11191. Re: [DrakeRadio] TR7

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-01 00:07:19 UTC
From: scpmiller@aol.com
Topic: 855 Message: 11191

A little over a year ago, I bought a TR7 off of the auction site. The description read: radio lights up and goes dead. Sure enough, that's what it did.
I checked the usual suspects: the pin diodes - but all were good.
I couldn't find the reverse polarity protection diode and asked the group and was led right to it (it's on the back of the AF/RF/on-of switch) by several helpful people but like the pin diodes - it was fine.
Now what? Here's what I did next: the power supply card is located on the right with the radio upright and facing you. I took the covers off (top and bottom) and flipped the radio over so now the power supply card is on the left. Under where the power supply card plugs in, you can access each pin of the power supply card. Using an ohm meter I measured the resistance to ground on each pin. (BTW, the PS-7 supply is not plugged into the radio during all of this).
Sure enough one of the lines was shorted to ground - I believe it was the 10 volt line. (I am doing this from memory as my notes are out in my workshop).
It looked like the 10 volt line goes to a lot of the boards so one by one starting at the back of the radio with the IF board, I removed each board until the short circuit went away. I got to the up convertor board, pulled it out and viola - no short circuit! At first this made no sense - I saw nothing wrong with the board but then I realized that there was one part that was a perfect dull black, tear drop shaped part - I have looked at a few up convertor boards and that part didn't ring a bell. I swapped in a spare up convertor board and the radio came to life and has been fine ever since. It turned out that the dull black part was a fried Tantalum cap on the 10 volt line into the card and it took the power supply right to ground.
The TR7 (like the R390A) is a marvelous design in that each circuit area is a module of its' own and often times trouble can be isolated down to the module level by going the through a simple isolation procedure. It was time consuming but I got a chance to clean and de-Oxit each connector while I was at it. The effort was worth it - the radio is very nice cosmetically and plays very well now. I nailed the Santa Clause Special event station in Finland with it a couple of days ago as a matter of fact.

Of course your mileage may vary but my money is on this being something simple, the real question is: What module is the problem on?

Good luck.

Brenton -

Perhaps it blew because that is a 5A fuse, NOT a 0.5A.

Fuses 'do' fail from old age, so it's worthwhile to try a 5A fuse before digging too deeply into the
radio.

Radio Shack still has fuses, I think. It only has 14 VDC on it, so a 32V fuse would work just fine.

From: Brenton Crowhurst
Topic: 855 Message: 11192

My thanks to Jim, Steve and Garey for jumping in here. I thought, when I saw your responses, that I must have mis-read the values on that first fuse that blew, but I found it in the shack garbage, and sure 'nuff, it's as I said.

I'll go hunting for a 5A fuse . . . well, not tomorrow.

And I'll also try and extract the one I dropped to see if that's actually blown.

I'll report back so you know what's happened.

Again, my thanks and a 73 New Years to you. And all on the list, of course. A great resource this is!

Just to confirm, the loose fuse was recovered from the radio (1A, 250V) and it's blown.

Due to moving, I need to divest myself of my electronic hobby equipment. Click the following link to see the list and pictures. Click on any thumbnail for a hires version of the image. There are a couple of Drake radios at the top of the list.

I will be listing more items and will send an update when I get those added to the list.

11197. C-line shifting frequency?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-01 23:46:57 UTC
From: w6mqi
Topic: 11197 Message: 11197

Having some interesting issues with a c-line one problem is while listening to the receiver the RF gain or sensitivity will drop by half as though a nearby station has swamped the AGC. I can bring the RCVR back to full gain by cycling the transceive switch on the T4XC from SEPERATE to RCVR or TX position, sometimes this won't work though. I'm not sure if it's the RF gain or AGC or a dirty switch I've cleaned every switch real well with no change.
Problem two: With the R4C passband knob set to LSB, filters set to SSB, and the T4XC set to LSB I then switch from SSB to xCW on the T4XC the R4C will shift up in frequency by 200-300Hz then switching back to SSB from xCW R4C shifts back down 200-300Hz. Also while listening to the R4C by it's self with T4XC power off I then turn the power on to the T4XC, R4C will shift up in frequency confused? I know I' am
Other then these two issues the c-line works fine the R4C has all filters, and every Sherwood mod available, but you know what I still like the sound of my R4B better then the R4C the R4C seems a bit pinched or lack's the audio range of the R4B to my ears anyway.

73,Dave

11198. The trusty, crusty T-4XB

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-02 00:13:38 UTC
From: Steve Wedge
Topic: 11198 Message: 11198

My auction bargain came to life today!

I checked all the tubes on my TV-10 military tester and all were fine. While they were out of the rig, I took a q-tip with some Cramolin on it to all tube pins. I fired it up with my station AC-4 and R-4B and cycled the band switch a bunch of times. The VOX and antivox controls also needed some adjustment, but I'm happy to say I can get 150W out on 80 - 20, about 70W on 15 and 100w on 10, so the finals are good! Looks like the neutralization is a wee bit off, so will need to do that after cleaning.

The front panel and knobs are in very good shape on this one, but the right rear chassis is quite crusty/corroded. I will need to take this one apart and wash it prior to deciding how to stop further damage to the chassis. It looks like I can save this rig from the scrap heap, though, and that's always a good thing!

Cramolin was the Deoxit of its time. Once very common
stuff. I have no idea what was in it or why it disappeared
from the American market. Maybe toxic maybe some other
reason. I used a lot of it way back when and it worked very
well.

Hi Folks,

You might find the attached website article interesting. It describes how to interface a simple frequency counter kit (purchased on ebay) to your Drake twins:

http://www.k3jls.net/twins.html

I have no financial interest in this product, but I wrote it up just for the heck of it. I'm still working on some minor issues.

Please drop me a line off-net if you'd like to discuss.

73's and Happy New year All!

Joe - K3JLS

11205. Knob white lines

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-02 16:24:11 UTC
From: Mike
Topic: 11205 Message: 11205

Hay gang.

Any hints at re-whiteing (?) the knobs from a R series receiver?

They are in good shape but the line pointers are quite yellow.

Bleach? Repaint?

Soap and water didn't do much

Mike wb8vge

Hi Mike -

Lotsa options! In no particular order.

White-out correction fluid

White artists crayon

Lacquer stick (Actually the product MADE for this task!)

Testor's model Paint

All are applied, then the surface of the knob is wiped leaving only the line. The original can be
scrapedout with a toothpick or 'orange stick' etc.

Probably others I've missed.

I've been using a Liquid Paper product called a "Correction Pen." It applies the white-out from the ball-point tip right into the engraved line. The pen is squeezed as the ball-point travels down the line. The edges dry in less than a half minute. Then, wipe the waste away for a perfectly edged line. The white out liquid seems to keep it's brilliance with aging and heat.

Paul, W9AC

I use white Acrylic artist’s paint in a tube, any brand, available any good hobby or arts supply store.

After cleaning the knob with any home cleaner and drying, I overfill the groove with the paint and wipe excess with a damp paper towel, pressing down a bit to get a slight indentation. Not necessary to remove old paint.

I can confirm Dupont No.7 rubbing compound works fine
on plastic. I have Simichrome but can't remember if I've
tried it on plastic. Its a paste with jeweler's rouge in it.
The best mild abrasive is toothpaste. Its worth trying
before using anything stronger.

Hi Larry,

Thanks for the comment. Yes, I did see Larry's counter. It's more versatile as it has the ability to store more than one frequency offset, but I like this one because it has the larger, seven segment displays (easier on the eyes) and comes with a 'matching' enclosure - nothing else to buy or fabricate.

It's perfect for my purposes.

I have a Unique Radio Parts LLC replacement for the can lytic used in the 2B power supply.

This NOT a can but four radial lead lytics mounted on a circuit board with lugs so it is a drop in replacement for the original can

Item is new, never used. Comes with replacements for the two resistors on the original cap as well to simplify installation

Asking $15 which includes postage in USA

Topic: 11202 Message: 11226

Goran -

Please explain to me why a digital display is 'a must' for low band DXing. I can easily set ANY of
the Drake 4 Series radios to within ~100 Hz of a specified frequency using only the Calibrator and
original dial. That is certainly close enough to 'find' any specified station, perhaps with a 600
Hz tone rather than a 400 Hz, or a slightly garbled SSB signal.

I have no problem with those who prefer digital dials, and/or who want to modify their own radios, I
just don't understand the need to make such drastic modifications to an existing radio. It's
certainly much easier and cheaper to build a radio with a digital dial, one of the toughest things
to design is a good variable oscillator that is linear across a range.

Just wondering.

Hello again,

I would agree that a properly calibrated analog Drake dial is very accurate. However, at least in my R4A, the dial is not perfectly linear and does require recalibration at each 100 khz point.

By contrast, the digital dial is linear throughout the tuning range, is very accurate (after the receiver has warmed up a bit), is much easier to see, and does not require any mods to the R4.

Ralph has posted another batch of frequency counter kits on ebay if anyone is interested. Here's the link:

http://www.ebay.com/itm/Frequency-Counter-Kit-6-Digit-50-Mhz-Built-In-Pre-Amp-With-Case-and-Lens-/140902707781?pt=US_Ham_Radio_Transmitters&hash=item20ce74b245

11228. aluminum electrolytic capacitor failure mechanism(s)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-05 02:19:17 UTC
From: William Houghton
Topic: 11228 Message: 11228

All,

Does anyone know the failure mechanism(s) of electrolytic capacitors? I have heard/read that the electrolyte dies out over time. We all know to replace them in our old tube rigs. Does this happen only while voltage is applied? Does this happen to NOS caps that have never been used? I have seen several NOS caps sold on ebay and I can't imagine why anyone would buy 30 yr old caps unless the buyer is simply ignorant.

Also, I have never heard of anyone replacing electrolyitc caps in solid state gear even though a lot of early SS gear is now 35+ years old.

73,

Bill

Yes NOS will fail over time even if not used. The shelf life of an electrolytic is about 15 years they start to age as soon as they are made. This is much the same as coax cable. You can buy some " still in the box and not used" but coax starts the aging process as soon as its made.

Yes the aging process starts immediately. NOS caps are aged. Electrolytics have about a 15 year shelf life even if not used. This is not to say they will not function but they have aged. This is similar to coax cable, you can buy new never used cable that is 10 years old but all it means is that it is 10 years old and aged, as coax starts the aging process as soon as its made.

New gear frequently has electrolytic's fail and they are replaced all the time. New components can fail too but not as likely.

I have replaced numerous electrolytics in solid state equipment over the
past 50 years servicing lab and industrial control equipment. The failure is
generally not a shorted capacitor but an open or decrease in value so the
failure is not as obvious but it is failed. Gain and response usually
suffer. The unit keeps "working" but not up to spec.

11232. Re: [DrakeRadio] aluminum electrolytic capacitor failure mechanism(s)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-05 02:51:03 UTC
From: Don Cunningham
Topic: 11228 Message: 11232

Bill,

Way back, before it would have been even 10 years old, I had to replace ALL the electrolytic capacitors on an Icom IC-751, and that appears to be across the models of many of the Icoms of the late 70's to mid 80's at least. The display would come on after a LONG wait, or not at all. Radio still worked just fine, you just didn't know where you were!! At first they only recommended certain caps, then later said just all of them to keep from going back in there so much.

I suspect we will see electrolytic and tantalum caps begin going bad on the TR7/R7 series as well. Just my opinion on that though, but they are over that 15 year level. I have read many places that new computer LCD flat screen monitors that fail, even new failure, will be fixed by replacing bad electrolytics.

I buy NO NOS electrolytic or tantalum caps. Most are as suspect as the one in your rig, and the newer ones have better specs!
73,
Don, WB5HAK

In 1968 I bought ten feet of "Columbia Super Flex" RG-8/U coax, cut it into 3 pieces and put connectors on it. All 3 pieces are still in use now and working good as new. Replaced the connectors on one piece a year ago.

Bill,

I need to correct my last. I replaced all the capacitors on the display board only on the 751, not the whole rig, as my mail would have suggested.

You haven't been listening. ;)

Heat is an enemy of electrolytics. They should be replaced with parts rated for 105C temperature whenever possible. Power supply circuits fare the worst, especially switch mode power supplies where the caps have to handle hight currents at high frequencies.. Electrolytics on the TR-7 DC-DC converter board are on my "always replace" list, for example. Got a dead computer power supply or LCD monitor? Re-cap the power supply. The bad ones are usually easy to spot, they are bulged/split/leaking. In a semi-operational power supply or circuit, failing caps are often warm or hot to the touch (but be careful, the can will often have voltage on it).

Failing decoupling caps can cause motorboating or excess noise in audio circuits and strange behavior in other circuits. Audio performance can degrade gradually as coupling and frequency response shaping caps fail, and is often not even noticed by the owner.

Electrolytics are evil hellspawn, but they are necessary. But that's just my opinion. Maybe someday I'll tell you what I REALLY think.

Gary,

I agree with you that R-4C is accurate when calibrated.
But one advantage with the digital display is that I no longer need to use the Calibration-switch. What I see is what I always get. This is also a great feature when switching between Bands. No need to re-calibrate at band switch or when moving across the entire band.

I always use narrow filters and on very weak sigs at noise-level sometimes the 10Hz resolution is also good to know. On 160 m the sigs can be completely gone for minutes and if I know the digit I know exactly where to listen.

Perhaps this is also personal. It's a matter of taste. I have nothing against an analogue display. I grew up with it. But I feel a "number" is easier to handle when part of the brain is linked to the computer screen.

I modify my R-4C because it satisfy me and as a result I have a much better RX compared to my FT-1000

Does anyone here know the aging mechanism in RF Coax? I have had to replace 42 year old RG59 recently in my Dad's attic, that had become lossy. Seems to me that solid polyethylene and copper wire are very stable, especially if away from UV (sunlight) and sulphur compounds. But, something clearly is working on coax over the years to cause loss. I'm going to suggest it is all dielectric loss. One easy test is to strip out some of the center insulation from suspect coax, put it in a home microwave with a cup of water in there to prevent oven damage. Lossy plastic will heat up.

Subject: Re: [DrakeRadio] aluminum electrolytic capacitor failure mechanism(s)

Yes the aging process starts immediately. NOS caps are aged. Electrolytics have about a 15 year shelf life even if not used. This is not to say they will not function but they have aged. This is similar to coax cable, you can buy new never used cable that is 10 years old but all it means is that it is 10 years old and aged, as coax starts the aging process as soon as its made.

New gear frequently has electrolytic's fail and they are replaced all the time. New components can fail too but not as likely.

David -

I believe one failure mode is migration of the carbon in the black jacket into the polyinsulator.

Another would be moisture, which is almost impossible to keep out.

Dave and all,

If the coax was in the attic, the high temperatures during summer probably accelerated the aging process.

Hi Guys,

Well, I cut my eye-teeth on a 3rd-hand Hallicrafters S-77A general coverage receiver here, from the time I first got licensed in 1971, to 1985, when the XYL "...upgraded" me with a Christmas gift of a brand new Yaesu FT-980 transceiver...

To anyone who is unfamiliar, the S-77A is the AC/DC version of the S-40---and both had a frequency resolution of "...plus, or minus, one quarter inch"...! Contrast that to the frequency read-out of the '980---to the nearest TENTH of a Hertz---and the difference was quite astounding to one such as myself (like going from a Model "T" Ford, to a Mazzeratti, in one easy step!).

Maybe as a consequence of this "impoverished" background, I really & truly do NOT mind the existing analog frequency read-outs of any of the Drake "Twins" whatsoever---in fact, I wish I had stuff that was even HALF as good back as my R-4 / T-4X combo back in '71!

I wonder how much good DX has been missed because someone didn't find it on the exact frequency that was posted on a DX cluster. In this modern age, we still need to tune. A digital display (or any display, for that matter) is only as good as the operator behind the knob.

Hi Jim,

You reference what is surely a double-edged sword! Hi Hi

I wonder how many guys have grown frustrated at the QRM generated by so-called "DX'ers" who no longer comb the bands themselves, but have their eyes glued onto the screen of their laptop, then call "blind" whenever they see something posted that's interesting...?

There's still a LOT to be said for the old adage of "...listen, LISTEN, then L-I-S-T-E-N again!" whenever it comes to chasing (and successfully CATCHING!) DX...

You're right: just as in a car, a radio station is only as effective as the nut behind the wheel / dial! :o)

11251. Astatic T2M mic wiring

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-05 17:39:00 UTC
From: Tom
Topic: 11251 Message: 11251

Hi, I'm trying to figure out whether I can use an Astatic T2M microphone with my T-4X. I have the proper three-contact plug, Switchcraft as I recall.

The mic has the keypad which of course I do not need. It has a 4-pin connector with red, black, clear and bare leads.

My t-4x manual instructs how to wire based on the PTT, mic and common leads. I've made one try at tracing the leads through the mic circuit board but haven't figured out which is which, hard to see under the two pots on the board.

I found one reference which said tip is black for PTT, ring is clear for mic "hot" and shield is ground wire common to PTT/mic but that's for a 3-wire mic....

Advice? Can I leave the keypad in there? Thanks 73

See: http://canadianastatic.com/Canadian_Astatic/CB_Microphone_T2M.html

It's a pre-amped electret, so it should work. How you power it will depend on which version you have, but it's not going to be "plug-and-play".

Tom,

There are several versions of the T2M but I do not have information for any of them. I believe, however, all are low impedance electret mics that will require 3-12VDC (I believe...) to operate. Unless you build an interface to provide power, and possibly impedance matching, you will not be able to use that mic with your T-4X.

11256. Re: T4XC Power fluctuation

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-05 19:33:46 UTC
From: w6mqi
Topic: 10629 Message: 11256

I'm back to trying to find out why there's power fluctuation only in TUNE on all bands with my T4XC. Pulled out C102 and didn't look to see it's correct placement in the board for polarity so I could put it back correctly. The cap has a black stripe going around it, and on one leg there's a break in the stripe would this be the positive leg? I'm usually pretty good about marking or taking pictures , but this time I got a little a head of myself.

Hi Eddie,
The socket is round approx 3/4 inch with 4 pins/sockets, the pins are not equally spaced, the top pair are further apart than the bottom pair. I could send a photo but will have to disconnect the gear.

Many thanks
Howarth. GW3TMP

Hi all, I am still looking for a Cinch Plug type 5AB2 for my R-4C. If anyone has one in their junk box I would be very grateful.

Dave -

I'm not sure. Looking at the CD, there is a blue stripe on the 'left' side of C102, and that is the
lead that is tied to R82 and Pin 8 of V9, which is the positive side according to the schematic.

Dave -

Just looking at the schematic again, have you tried swapping V1. That is the transmit ALC control,
and ALC does NOT work on CW. Seems I've run into this before.

This is the connector that Drake used for the Calibrator and Accessory sockets on everything from
the 2-A to the R4-C. They were hard to find in the 60's!!

They're similar to the polarized plugs that were used for multi-voltage battery packs in 'portable'
radios, and as speaker plugs in some auto radio setups.

I suspect the only place you're likely to find one today is in some Drake antiquarian like me, and I
don't have any! They are second only to the two pin Linear control plug in the hard to find class.
ANY junker receiver will have at least two, the 2-C has three! I think Drake bought a close-out
lot!! :-)

Garey
Swapping V1 did nothing also swapping out C102 with a .1uf cap for testing did nothing. The positive side of C102 is where the black stripe has a gap which goes to pin 8 V9B. I did notice that S1D(r) did look a little on the black side so I cleaned it with Deoxit real well this seemed to quiet things down, but there still some fluctuation happening.

Dave

The cap has a black stripe going around it, and on one leg there's a break in the stripe would this be the positive leg? I'm usually pretty good about marking or taking pictures , but this time I got a little a head of myself.

These were prettly common in car stereo systems at least into the late 70's, when we started seeing BTL outputs and front/rear speaker systems. Most of them have since taken a dirt nap or gone to the scrap yard crusher. I think Radio Shack even sold replacement cable sets with that connector in days gone by. They seem to have gone extinct in the wild now, and those of us who need them have to homebrew them. Somewhere there's probably someone who is sitting on a warehouse full of NOS under-dash 8-track players that has a ton of them. I've been looking...

The pattern looks about right, but being DIN, the dimensions are probably
Metric. My guess is that it wouldn't mate up properly.

Ken's Electronics is listing the 5AB2 as "out of stock / disc / nla". He might
have the dimensions.

I've noticed a tendency for people to post the frequency that they worked the DX on. This is especially apparent when the DX is announcing a listening range, like "up 5-10". The spots will jump all over the place with different reports. Whether this is intentional or an effect of automated spots from a logging program that pulls frequency data from the radio, who knows? I just listen for the pile and try to slip in through a lull.

What you are looking for is a #47 lamp. Plenty of internet sources carry these. Well stocked auto parts stores used to carry them, and even Ace Hardware may still have them. Radio Shack has something that may be usable, SKU# 272-1110. Garey can tell you the number for a longer-life equivalent.

If you want to make the purists cringe, Cointaker has a "warm white" LED replacement that actually looks pretty good in some applications. Cheap, too. I ordered a bag of 10 a few months ago, they came in well under 10 bucks and arrived promptly.

http://shop.cointaker.com/product.sc?productId=31&categoryId=6

Other vendors, including some hams, also sell LED replacements. Some are drop-in like the Cointaker lamps, some require modification.

All I can say is I don't see the fun in anything so
formalized and serious. Anyone who has enough money to have
a good location and excellent antennas can do well at DX or
contests. I really think this has become a game for those
who are not really much interested in _radio_.

They still make chassis mount female connectors for DIN 4 pins so if nothing else you change out the Cinch for a complete DIN setup.

I got a little carried away the other day on this. There are at least two of the 'female' of this
connector set on each Drake receiver from the 2-A to the R-4C. Unfortunately, the ONLY 'male'
version is found on the Q-Multipliers, 2A, B and CQ. The Calibrator 'plug' is a part of the circuit
board, so isn't much help here.

The DIN plug suggested by someone 'might' work. If anyone wants to try it, or start a 'cottage
industry', I just added a drawing to the FILES section of the list. I can't find my 'real' drawing
program, so this is a 'non-scale' version in PAINT, which I had never tried to use before. I havea
lot more respect for Gary Johanson' and his vintage schematic drawing program, also done in paint.

11276. Rx to Tx VFO causes Rx signal drop

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-06 16:11:35 UTC
From: wb4spt
Topic: 11276 Message: 11276

T4X/R4A:

In my situation at least two bands show a full S unit drop in Rx performance when I go from Rx to Tx freq control. I'm going to suppose this is due to less than optimum Tx injection into the Rx.

There are some hard to understand references in the Tx alignment instructions about plugging into the INJ port and using a sig gen for tuneup. Anyway, I don't have access right now to a sig gen, so is there an "on the air" tuneup I can perform to increase the INJ level into the Rx? Maybe more to the point: should I be adjusting the Rx or the Tx INJ trimmers? Yes, I'm using RG62, maybe 2' long as INJ cable.

Well, I learn something(s) every day. Bought that at a hamfest for $2 because I liked the cord and retro look and feel. No idea mics require power or that mics for CB differ that much from ham.

Yes, electret mics require power. So do mics that have DTMF keypads. Electrets have become quite popular in the two-way radio market, they are cheap to manufacture and sound good. There are quite a few of them on ham rigs these days. This is not a CB mic, rather, it was targeted at the commercial Land Mobile market. It would also be useful with a VHF/UHF ham rig that does not have a DTMF pad. It should also work nicely on your T-4x, as preamped electrets are high output and can drive a wide range of impedances. Depending on which verison you have, you can either power it directly from a 12VDC source or insert power on the audio line through a network of a resistor and a DC blocking cap.

From: Garey Barrell
Topic: 11276 Message: 11279

That is excessive.

Best procedure is to align the INJ trimmers on both units, per the alignment procedure, with the two
cabled together. This will get them as good as they can be. Watch the RG-62 for shorts. It doesn't
like to be bent sharply, and it's easy to overheat when soldering connectors.

The signal generator into the INJ port is for radios that have had 'all the loose screwstightened',
or a brand new radio that has never been aligned.

Thinking more about it, I've run across oddball power supply bricks in the past that had 4-pin DIN connectors. IIRC, the pins are smaller than the 5AB2, and the spacing is wrong.

Topic: 594 Message: 11282

Garey
Shortly before Xmas I mentioned that I had a problem with the R-4C. As you will have dealt with hundreds of problems since then I'll refresh your memory.
The Rx works but suddenly the sensitivity went off on 20m. On 14.000khz I could just hear the calib sig but on 14.025 it was about S5. Go up to 14.050 and it was barely audible. Sigs were the same.
You suggested checking the pre-select rack which I have now done. All the slugs are sitting comfortably and all the same height - 11/32". Also checked and de-oxed the switching and all the associated wiring seems OK.
Now we come to the strange bit. On the top chassis there are 4 banks of trimmers and on each bank there is one marked 14.3. If I touch the 14.3 nearest the front panel (just underneath the meter) the 20m band comes back to life and this happens irrespective of what freq I have the PTO set at. A fraction of a turn of the trimmer to the left and the RX is alive and a fraction to the right leaves it deaf - this is on 20m the other bands are OK.
So, in a word, I'm lost. This is the second time this has happened and each time just barely touching that trimmer has brought 20m back to life.

Any ideas, please?
Vic

I think you have a bad trimmer. I am not sure what
kind of trimmers these are in the C model but it sounds like
this one is shorting. That can happen to compression
trimmers when some dirt gets between the plates and pokes
hole in the dielectric.
Try getting across its terminals with an ohm meter and
see if you see the short.

Trimmers will sometimes respond to cleaning. Open the
trimmer as far as you can and blow it out with spray
alcohol, then let it dry thoroughly. Its best if it can be

removed entirely but you may have some success without having to do so. If cleaning does not work you may have to replace it.

From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 11285

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

I've still got Krusty the Transmitter apart (an R-4B). When I had verified that I had got it working prior to stripping and cleaning, I do recall that receive was occasionally flaky. I figured I'd lightly hit the contacts with some 2000 grit paper but upon looking at the construction and where the relay is, it appears I'll have to take the RF deck apart.

Anything to watch out for underneath? It looks like a lot of work, but I'm into it this far so I might as well go the distance

Vic -

Sounds like you have it localized. That first trimmer is the plate circuit of the RF Amp stage. I
would suspect a broken solder connection, or perhaps just a piece of metal around the trimmer, or a
dirty switch contact. I would first tune in the Calibrator on 14.3 (I think that is the alignment
frequency) and then carefully peak the PreSelector. Using a non-metallic tool, rock that first
trimmer cap adjustment around a turn or two in each direction, and then re-peakit.

If still intermittent, carefully inspect the wiring switch contacts and fixed capacitors associated
with that trimmer for shorts and/or solder problems. Also check all the screws in the area for
tightness, if you have already done so. Check all connections around the tube socket (V1), and
DeoxIT the tube pins.

Lemme know!

Topic: 10629 Message: 11293

Well this power fluctuation is proving to be a bugger to find it's now intermittent. V9 checks out ok no fluctuation there, I'm seeing it on the grid of V4, but now I'm at a stand still the power output is rock solid things have decided to work or stop working :-)So here I sit waiting for the power fluctuation to return this could take awhile.

Dave -

Have you inspected R44 and R45 for condition? Mechanical stability?

Dave - I had a similar problem with my T4XC back in 2001 and it took John Kriner two whacks at it to find the intermittent problem. Here's John's note describing the issue and his fix:

"I initially found the transmitter to work fine. After alignment, I did observe it doing exactly as you described. Then, the problem went away!. I tried poking, proving, tapping, and cursing to no avail. I finally set it aside, and went on to the receiver. Afterwards, I again observed the same symptoms. I traced it to the balanced modulator (T-14). I removed the can and re-soldered the diodes. I also noticed that one point had a long solder "ear," which may have been intermittently shorting to the can when hot."

Don't know if this applies to your situation but just in case thought I'd send it along.

Good luck!

73 - Dino KL0S

Garey
I'll check R44, and R45 tonight. So if there is something wrong inside T-14 i.e. diodes is there any luck repairing these? I do have a spare T4XC that I bought for possible parts swap might be easier?

Dave

I've worked on the balanced modulator in a T4XB, I think
they are identical. They are not hard to work on at all. The
can can be removed by compressing the clips with a pair of
pliers. Slip it off and you can see the diodes on the board
at the top. A careful inspection should turn up any whiskers
shorting to the can or loose leads. Actually, if there is
an intermittent short in it you should be able to see it by
just tapping on the can.
I got pretty deeply into the balanced modulator because
I could not get a carrier balance on mine. It turned out
someone had switched two leads under the chassis. They
looked OK but were wrong and the change in stray
capacitance prevented the carrier from nulling correctly. I
spotted this after long struggle when I got Garrey's disc
and looked closely at the photographs in it.

Dave -

OK. Yes, I mentioned the diode possibility a message or two back. Really pretty rare, I've only
seen one case. With care you can get the can off without removing any wiring. The one I saw all I
had to do was push in on the diode lead that was sticking out a little too far and touching the
can. It doesn't take much clearance.

Besure and check the switch wiring for R45. It's supposed to be in circuit in TUNE and shorted in
other modes. It limits screen current in the PA to protect the PA tubes in while tuning.

Garey, and everyone else.
I checked out the resistors you mentioned all checked out ok, but I gotta say R45 if it were bad it would be the resistor from hell to replace. I went through tightening ground nuts and screws and found some loose ones, and the screws holding S-4H(F),S-4G(F) to the sheet metal plate were very loose. I don't know if I broke it or not while trying to tighten S-4H mounting screws , but I found R50 broken in two
so I replaced it. Well so far I can't get the T4XC power to fluctuate things seem to be working so far. My next issue is the R4C I'll start another post on that one later.

Thats only the screen resistor for one tube. I'll bet
that made a difference:-) I've seen resistors that cracked
but were still making contact. Very intermittent and heat
sensitive. Might very well be the answer. Congratulations
on spotting it.

Richard
Thanks will see I'm not putting the covers on just yet I think I'll leave the units on the bench for awhile and see what happens. Never fails as soon as one goes to put the rigs back together it decides to start acting up again hihi.

FWIW, I don't think you broke the resistor. They are a
lot harder to snap they look. I suspect this was from years
of stress, probably heat stress. I've seen a lot of
resistors that _looked_ fine but came apart when wiggled.
One trick I learned long ago was to wiggle wires. Either
with needle nosed pliers or some sort of insulated stick
(chop sticks are handy). You can find all sorts of things.
I found a wire in one of my Drakes that had _never_ been
soldered. Also found this in a General Radio instrument.
When wires are wrapped before soldering they sometimes make
good enough contact to last for years without the solder.
Another thing I learned, this time at -hp- where it was
a rule: if you spend some time on something and can't spot a
problem get someone else to look. Its surprising how often
your eye can pass right over something obvious that someone
else will see instantly.

Dave -

OK. It's a process of elimination. ! A cracked R50 could certainly cause power fluctuations, so
perhaps you fell over it! That happens more often than the 'experts' like to admit.....

I've got several of these projects going at the moment, and sometimes they run together. I think I
told you to check R50 - R54 for value and condition, those are the culprits that can be damaged when
one or more PA tubes weaken or fail outright. They are 'first steps' in any new transmitter overhaul.

Hopefully you got it! On to the R-4C.... :-)

11304. FS Late AC-4 with 120/240 switch

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-09 00:50:42 UTC
From: Steve Wedge
Topic: 11304 Message: 11304

Excellent condition, late s/n (57389) Drake AC-4. This is a rare version of the AC-4 that has a 120/240V AC Input switch and factory 3-wire AC cord.

I figure this supply will especially appeal to folks where 220 - 240VAC is the normal mains power, so I will ship international. I won't be able to sell to some countries so please ask and I will research.

Shipping extra - shipping weight will be 20 lbs and the power supply in its original factory box will be shipped in another 14 x 14 x 14" box. I've factored the shipping materials into the price but not the shipping, which will vary.

Email me for the price and particulars. There will be a surcharge for PayPal, and I will take checks and trust our folks here enough that I will ship on receipt of payment. Pics available upon request.

Steve Wedge, W1ES/4

Time flies like an arrow; fruit flies like a banana.

All my computers have my signature with various pearls of wisdom appended thereto.

11306. Need an SW-4A schematic and alignment instructions

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-09 20:53:42 UTC
From: w5ida
Topic: 11306 Message: 11306

Hi all,

I'm trying to resurrect a Drake SW-4A short wave receiver. It would be very helpful if I could get a copy of a manual showing a receiver schematic and alignment instructions. BAMA and similar sites don't seem to have any helpful material on this receiver.

Any help from the members of this group will be greatly appreciated.

Thanks in advance.

John, W5IDA

John, I have two saved on my computer I can try and send you. One is about 2MB and the other is 10MB. You will want both as one is easy to read and very good photos but the schematic is in 3 parts. The other is also easy to read but the photos are poor but the schematic is on one page whicj is handy. I'm not sure how large an attachment I can send, but I can send one at a time for you.

FYI,
On that website, we have 185 DRAKE manuals/documents available, for free, plus thousands of others, for most other brands. We're still building our inventory of manuals and schematics. If you ever want to send any to me, I will get them to Gary, who operates the website, and will happily make them available, for all.

11311. Re: T4XB Low Output

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-09 22:48:01 UTC
From: Tom
Topic: 8812 Message: 11311

I know it has been quite a while since I posted this topic but the problem is still there. I have determined that the problem is not in the function switch (I think). I will try again to describe the problem. When I first turn the transmitter on the output is very low. I turn the function switch to the x-cw position and back to tune and power output comes up. Over time it drifts down very slowly. If I rotate the switch a couple of times it comes back to full power. Then starts the slow drift back down. It acts as if something (cap?) is discharging. I have cleaned and rotated the switch many, many times. That's why I figure the problem is somewhere else. Don't get much use out of the rig brcause of this. Sure would like to make some progress so I will welcome any suggestions. Full output is around 120 watts and it drifts down to around 30 watts over time. HELP!! Thanks in advance.....Tom

From: Al Parker
Topic: 8812 Message: 11312

Hi Tom,
I haven't been following your earlier thread, but see that it maybe
focused on switch cleanliness.
I'd check the dropping resistor in the line to the driver's plate, it's
R-44 on the T4-XC, maybe same nr in the B. It may have drifted high in
value and gotten more sensitive to heat, making it go higher. Similar
on the screen resistor there, R-43. I've had that plate resistor cause
a reduction in power in some that I've worked on.
Also, I have the following in my archives, from K9JU in Nov. 2010:
==========
I've mentioned this before, rather recently, but check CR19 in the
cathode circuit of the driver, V4 (12BY7). I have 2 T-4XC transmitters
that exhibited sudden drop (to nothing in both cases) in power output.
Both had CR19 with cracks in the cases. The diodes would appear OK with
a DMM (diode mode) but with the application of heat would open up. Maybe
there's some intermediate mode that would allow moderate output power
but that doesn't seem to make too much sense. Most semiconductors work
or they don't work, in my experience!
A 1N4003 and up is good substitute for the B5G5 diode used by Drake.
Bob K9JU
==========

I hope this will be a help to you.

11318. Replacing the 3-part electrolytic "can" capacitor on the TR-4 main chassis

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-11 03:30:48 UTC
From: matt.newman10
Topic: 11318 Message: 11318

I need to replace the original 3-part electrolytic "can" capacitor on the main chassis of my Drake TR-4 transceiver. This particular TR-4 was manufactured in late 1966 (s/n 26104). The 3-part capacitor is a gold colored cardboard "can" located to the right of the VFO as viewed from the front. It's about 3-1/8 inches high and 1-1/8 inch wide. The markings are as follows:

CDE
CC0167A
50 to 80 MFD 250 W.V.
50 to 80 MFD 250 W.V.
30 to 40 MFD 250 W.V.
UPN 10682
AK

Can anyone recommend a new aluminum "can" replacement, or individual electrolytics as a replacement?

Also, does anyone know the capacitor numbers for these three electrolytics? I'm having difficulty locating them on the schematic.

Many thanks, Matt

Matt,

"Tom" in Garey's email is the owner of Hayseed Hamfest and provides nice, new multi copacitor cans for Drake gear (and others). Go to www.hayseedhamfest.com and you will see either just the multicapacitor can or a whole kit of replacement capacitors for your TR4. I've used a lot of Tom's capacitors and have been pleased with all. The capacitors will be shown on the schematic with an A, B and C after the designator. I don't have my TR4 schematic handy this late, hi.

11324. Drake T4xc transmitter

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-12 05:39:10 UTC
From: ka8asn
Topic: 11324 Message: 11324

I have a sick transmitter and need some help if possible. My problem is low output power and its getting weaker the more i work on it. It might be bad output tubes of 6jb6's but not convinced that that is the only problem. I did all of the resistance and voltage checks that are printed in the manual. Even tried to set the Rf trimmers for max output on 80 meters. no luck. I tried to make sure that slugs in coils t4, thru t7 are close to what the manual says. did not seem to help.When I did the resistance check I found that my values were dead on on some and way off on others.This is what I have found so far. On V4 the 12by7a pin one in my chart says infinite, my test showed closed. Pin two 2 the chart shows 97k,I checked 60k, pin 7 the chart says 5.5k I checked 4.0 k. Both of the 6jb6's pin 1, the chart says 6.5k I measured 3.3k and on pin 7 of the 6jb6's both pin 7,s the chart says 6.8k I measured 4.0 k. The rest of the resistance measurements were somewhat close to the chart. These measurements were made with a VTVM with the transmitter connected to the Ac-4 power supply but the power supply disconnected from the wall plug.

The voltage checks are different from what the chart claims them to be.V4 pin number 8 the chart said 160 volts dc I measured 140.V5 pin number 1 chart says 250 I have 240 close but is it enough.Pin 7 of th V5 chart says 250 I have 225 dc.V6 pin number 1 chart says 250 I have 220 pin 7 of V6 also chart says 250 I have 225 vdc. I Have not yet taken the voltage readings from the caps of the 6jb6's yet or any of the high voltage supply.

These readings were taken just as the manual suggest using a 11 megohm VTVM from ground and the transmitter was tuned up on 40 meters using a dummy load of 50 ohms using the correct tuning procedure the gain control was reduced to the very minimum with the mode switch left on tune using a Ac-4 power supply recently upgraded with the heath kit upgrade. At the test points inside the transmitter I have the correct voltages plus a little more.

It might be a possibility that my meter is reading wrong but other voltages my meter and the charts are right on. I was reading in another post that a suggestion to change the diode B5G5 in the cathode circuit of the 12by7a is of poor quality and a change would be a good thing to do. It also appears that R 40 in the 12by7a grid circiut is reading 17.0 ohms and the schematic calls for 15 ohms with 10% silver band on it. I think it shoud be changed due to lack of being out of tolerence.

I used to get 100 watts output when I left the unit in tune until the finals would get almost red,but that can't be right.
Any suggestions would be appreciated.

Thank You
Mike KA8ASN

11325. Re: [DrakeRadio] Drake T4xc transmitter

From: Richard Knoppow
Topic: 11324 Message: 11325

If the tube plates ran red for more than a few seconds
the tubes are probably NG. I have seen plates get red
momentarily and the tubes survive but these sweep tubes
don't have much margin for overheating. If the transmitter
was tuned up properly the plates should not show color in
"tune" since the power is cut down from maximum. Maximum
power should be checked in CW but with care in case there is
a problem. With decent tubes the power out on 40 meters
should be more than 150 watts.
I don't know if there are errors in the voltage and
resistance charts of the C, there certainly are for my B. I
suggest getting Garrey Barrell's CD which has a lot of
information not in the handbooks or anywhere else.

11326. Re: [DrakeRadio] Drake T4xc transmitter

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-12 15:33:34 UTC
From: Garey Barrell
Topic: 11324 Message: 11326

Mike -

I think you have a dead set of finals. Is the IDLE current set for 0.070A, and have you had to
reset it recently? If you have a replacement set, try them before going any further. If you don't
have any, start looking for some and while you're waiting ... :-) If at all possible, get
Sylvania, Zenith, RCA or GE branded 6JB6(A). There appear to be 'some' rogue tubes that are taller
than the specification of 3.125" seated height, and will not fit in the PA cage, so confirm with the
seller that they are under 3.125". As mentioned below, you might want to pick up a set of 6GJ5(A)s
for test purposes. Same brand caveats as with the JB's. They are considerably cheaper, and work
just as well, although 'some' seem to have trouble getting all the way to 10M....

I don't put much stock in the Resistance or Voltage readings in the manual. They sometimes remain
unchanged when schematics are changed, and can lead you down a rabbit hole if you let them. Most
variances can be accounted for if you trace the _correct_ schematic for your radio. Worst are the
ones that measure resistance back through the power supply. Too many variances involved in both
unit under test and test equipment, so if you DO get a 'correct' reading it's purely accidental! :-)

Your only significant voltage variance is the Screens of the PA tubes, and they read low in TUNE
because R45 is placed in series with the supply in TUNE mode to limit maximum plate current. The
plates should NOT show color under any normal circumstances, and allowing them to do so will weaken
and kill them in short order. You should be able to load the transmitter into a good dummy loadto
full power in TUNE mode (~145W on 40M) and sit for several minutes without showing color. I used to
run RTTY at full power for over 30 minutes at a time and PA tubes would last a couple of years. A
properly tuned transmitter into a well matched load should not show plate color.

Your 100W output indicates either improper tuning, a poor load, or weak PA tubes. Normal operation
would be ~350 mA of Plate current, at 650 Plate volts for 228W input power, and 120W output powerfor

about 52% efficiency. Deviation from these nominal numbers indicate an error in one or more measurements! The Plate meter is subject to error from shunt resistor(s) degradation, and output
power is subject to typical frequency variations, not to mention the +/- 5% of FULL SCALE of even
the BIRD 43. Most ham wattmeters are less accurate than that. So more or less output or efficiency
than this indicates measurement errors, and less 'probably' indicates PA tube deterioration.

When working on any of the 4 Series transmitters, I always arrange a small fan to blow air across
the PA area to minimize overheating developed in tuning / adjusting.

I keep a pair of 6GJ5 tubes that I use just for troubleshooting. My Sylvania/Zenith 6JB6's only go
into a properly working transmitter!

R40 is just a parasitic stopper, and it's value is not critical.

Start by checking R50 through R54 for value and condition. R53 and 54 should be within 5% of value
AND each other for proper PA tube matching. Check R43 and 44 for value and condition.

Substitute V1 if you have a spare, if not swap V1 and V9. If nodifference, swap back.

11327. Wanted 2-B Band Crystals

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-12 16:50:23 UTC
From: Darrell Bellerive
Topic: 11327 Message: 11327

I am looking for the following band crystals for my Drake 2-B. I want to expand coverage to all amateur bands from 160 meters through 10 meters. I already have the 160 meter conversion for the "A" band. I am hoping to find used crystals rather than have new ones built, but have the feeling these will be scarce on the used market. Here's to hoping though...

9.0 MHz for 60 meter band on switch position B
14.0 MHz for 30 meter band on switch position C
14.5 MHz for 17 meter band on switch position D

Third overtone type:
21.0 MHz for 12 meter band on switch position E
24.5 MHz for 10 meter band on switch position 10-1
25.6 MHz for 10 meter band on switch position 10-3

Please contact me off list.

73, Darrell VA7TO

Darrell
Check Mouser and DigiKey
There are many crystals there in the less than a dollar range that will work, if you find a frequency that is what you need, you just need to solder them in
Not the micropower type but many of the microproicessor / digital application type are ok.
I have done that on my 2B and some other tube and hybrid radios

Followed your suggestions and problem solved. Checked all wiring around V1 and de-oxed tube pins, switches etc. No broken joints. Tuned to 14.3 and then turned the trimmers both ways. After that I re-peaked and up came the calib sig - very strong. Checked on 14.000, 14025 and 14050 and calib strong and consistent at each point.
Rx working beautifully now.
Your help very much appreciated.

11331. My T-4X Wants to Transmit!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-12 20:10:12 UTC
From: Carl Maniscalco
Topic: 11331 Message: 11331

I'm having a problem with my T-4X that I can't figure out. It was working fine until, one day, it started going into transmit as soon as I plugged in my mic. It's not the mic because it did the same thing when I plugged in a different one.

A couple of possible clues:

1) CW output is intermittent; sometimes it puts out full power, other times it puts out nothing (I can get 100 watts or more out on tune-up, so the finals are okay).

2) I always run PTT but have had trouble with the VOX circuitry on this radio in the past, when it caused transmit to hang after I released the PTT switch. I had to ask George WB6YEC to fix that one for me but I don't want to keep bothering him with this, plus I would like to see if I can fix this myself. How else am I ever going to learn about boat anchors—even relatively light one like the Drakes?

Carl,

I'f I were at your side I would :

1) disconnect the T-4x from the R-4any to elminiate the Receiver from the equation

2) If the key is pluged in I'd pull that, and then examine the key for short or even those pesky knife switches

3) The Mic - unplug that for starters too

4) look over all of the switches on the front making sure that the USB position is used first.

4) Then plug it in and then turn the rig on - only go to SSB mode

IF the rig goes into xmit w/o turning it on, i.e., just plugging it in, then you have a problem in the mode switch for sure.

The VOX issue that you mention - move the vox and anti vox to the far position (least sensitive Vox and least antivox - sri I am not too clear on that) but the vox could be completely shut down.

God lucke with it,

Kris KM2KM

Hi Carl,
I'd worry that the bias supply is not doing it's job, probably because
the filter cap in it is bad. That can make it to go into xmit when you
turn it on, even if it's in SB posn or CW with a key plugged in & open.
If you don't shut it off quickly it'll fry your finals.
If the bias is OK, then look at the relay ctrl tube.

11334. Re: Drake T4xc transmitter

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-12 20:30:43 UTC
From: k5fex
Topic: 11324 Message: 11334

Will tell you what i discovered with my T-4XC this week. It has been exhibiting the same symptoms - no idle bias low output, cant load.

After extensive review of resistances, voltages, visual inspections, i thought that maybe the green stuff on the wafer switches could be trouble, first removed some with pencil eraser, then used DeOxit on each wafer. After spraying and letting set for a little while, I used compressed air to blow out any remaining liquid. Voila! problem solved.

Now, though, have new issue: low audio on transmit. I think i'v tracked it down to mic preamp tube (12AX7A) will be pulling it to test. But, without PEP output meter kind of hard to say for sure it's the audio levels. Key down on all bands at 250 mils gives at least 100 watts output on the meter.

> > I have a sick transmitter and need some help if possible. My problem is low output power and its getting weaker the more i work on it. It might be bad output tubes of 6jb6's but not convinced that that is the only problem. I did all of the resistance and voltage checks that are printed in the manual. Even tried to set the Rf trimmers for max output on 80 meters. no luck. I tried to make sure that slugs in coils t4, thru t7 are close to what the manual says. did not seem to help.When I did the resistance check I found that my values were dead on on some and way off on others.This is what I have found so far. On V4 the 12by7a pin one in my chart says infinite, my test showed closed. Pin two 2 the chart shows 97k,I checked 60k, pin 7 the chart says 5.5k I checked 4.0 k. Both of the 6jb6's pin 1, the chart says 6.5k I measured 3.3k and on pin 7 of the 6jb6's both pin 7,s the chart says 6.8k I measured 4.0 k. The rest of the resistance measurements were somewhat close to the chart. These measurements were made with a VTVM with the transmitter connected to the Ac-4 power supply but the power supply disconnected from the wall plug.
> >
> > The voltage checks are different from what the chart claims them to be.V4 pin number 8 the chart said 160 volts dc I measured 140.V5 pin number 1 chart says 250 I have 240 close but is it enough.Pin 7 of th V5 chart says 250 I have 225 dc.V6 pin number 1 chart says 250 I have 220 pin 7 of V6 also chart says 250 I have 225 vdc. I Have not yet taken the voltage readings from the caps of the 6jb6's yet or any of the high voltage supply.
> >
> > These readings were taken just as the manual suggest using a 11 megohm VTVM from ground and the transmitter was tuned up on 40 meters using a dummy load of 50 ohms using the correct tuning procedure the gain control was reduced to the very minimum with the mode switch left on tune using a Ac-4 power supply recently upgraded with the heath kit upgrade. At the test points inside the transmitter I have the correct voltages plus a little more.
> >
> > It might be a possibility that my meter is reading wrong but other voltages my meter and the charts are right on. I was reading in another post that a suggestion to change the diode B5G5 in the cathode circuit of the 12by7a is of poor quality and a change would be a good thing to do. It also appears that R 40 in the 12by7a grid circiut is reading 17.0 ohms and the schematic calls for 15 ohms with 10% silver band on it. I think it shoud be changed due to lack of being out of tolerence.

Have L-4B that has been sitting for about 5 years. Ready to get it up and going with the rest of the C line. Have 220V supply for the PS.

Looking for suggestions on procedures for cold start and any operating ideas for its use.

Carl -

Almost certainly BIAS supply failing. Excessive ripple fromhigh ESR electrolytic caps and do that.
(C5)

DO NOT leave the transmitter on if unattended. Complete BIAS supply failure can key the transmitter
and destroy the PA tubes, even if left in STANDBY.

Simplest fix is the AC-4R upgrade kit for the AC-4 which replaces all active components with PC
board mountedcaps and resistors. At the very least replace C5 and D7 before you turn it on again.

Check to make sure the tubes are in the sockets correctly and no noticeable damage. Open the bottom and see if any dust or dirt can be removed and visually look at components. Check power supply in the same manner.

Turn on in the low tap position and do not apply power let it just run, see that you are getting 1,750 or close on idlel. Make sure grid current is a zero and there is no plate current. Let it run at idle off and on for about 20 hours.

20 hours???!! Why so long? The P.S. Caps? The tubes (3-500Z's) sure don't need it..if they are gassy, as soon as the tube comes to temp, the gassy problem is taken care of.

Interesting. I'm with you up to the '20 hours'(?) part. An hour or two is more than adequate to
drive out any residual moisture from the transformers, which is the only benefit of running in idle
mode.??

If the tubes are 'gassy', running them at idle isn't going to help. I think this is the result of
an old 'Ham's' tale from before WW-II.

According to Bill Eitel, tantalum was used in power tube plates originally, and DID perform a
'getter' action when heated to red heat. This allegedly was the source of the pre-war 'story' that
if you 'baby'd' your Eimac tubes they lasted about as long as other brands. But if you ran them
HARD, they lasted much longer!

Unfortunately for us, tantalum was expensive and was no longer used in tube plates after the war, at
least up to the 70's, when the above was published.

If the power supply caps don't 're-form' in the first couple of minutes, they aren't going to. If
they'do' seem to re-form, they won't last very long. (Probably not 20 hours!) :-)

Okay, thanks for all your help. It didn't occur to me to mention that I'd already built the AC-4 with the kit from the Heathkit shop so I don't think that the bias is the problem. I have ordered a new 6EV7 VOX control tube (only $5.95 from Antique Electronics, seemed worth it) and will try all the other suggestions out.

Topic: 6245 Message: 11344

Well, did a few things today. New 6EJ7, and replaced R114.

According to the counter I have 12.645Mhz getting to C29. Akso seeing it on the "bottom" pin of T3.

However, the grid and plate of the 6AU6 mixer seem to show the 5.645 freq. Note: Counter is an old Yaesu YC500 with input impedance of 1Mohm.

I tried another 6AU6, with no change. I checked the resistance of the T3 secondary, it's about 2 ohms.

I do see a little increase in plate current above the bias setting at 7Mhz, but see a bigger increase at the 5.6Mhz.

While in there, I did do the resistance and voltage checks, which, like you I don't totally rely on them, but they were close enough to the table to tell me it looks like the circuitry is intact. At one point I did try a new driver tube and finals too, with no change.

One interesting thing I noticed is with the "Transceve" switch in "recv" the PTO light does not go out. Not sure how (or if) that is connected to this problem, but I did notice that the 16MHZ crystal freq does go away, so probably something in that particular curcuit.

So, still not there, but looks to me like it is something happening in the mixer stage. I will do some more "poking" later.

The CD sure has been a help identifying where parts are. That was a good investment!

Thanks again for the help...

From: russellhulett
Topic: 11347 Message: 11347

Wondering whether performance of these is essentially the same, seem to recall reading that was the case. The performance numbers found at one web site that tested old receivers indicated they were pretty close on the 20 kHz dynamic range. Would seem that for AM, the R4 might have an edge because of the 4.8 kHz bandwidth as compared to 3.6 on the 2B?

I own the first and have owned the latter, prefer the 2B from simplicity standpoint.

I have forgotten Eimac's name for the new plate
material and couldn't find an ad for it just now. I think
it is the new material that includes a zirconium coating for
gettering. Tantalum is inherently a getter when hot. I
don't think cost was the reason for the change but rather
the operating conditions needed by tantalum. There are many
applications where the red to yellow heat needed by tantalum
is undesirable. Other materials can also be used for
external plate tubes where the plate can not be run at high
temperatures. The change was made in the late 1940s but I
don't remember the exact year. It was at about the same time
that Eimac began to make and promote beam tetrode tubes.
They were properly afraid that the enormous number of triode
tubes supplied to the military during the war would come
back as surplus and kill their business so they held off on
the tetrodes until after the war and then concentrated on
them.
A patent search will show that Bill Eitel was the
brains behind both Eimac and Heintz & Kauffman.

On the burn in of 20 hours I may be wrong as it is from memory. However from memory in the last few years Eimac made the 3-500Z they were having a high tube failure rate after purchase.Their directions that came with the tube indicated the 20 hour warm up without applying RF. Again this is just from memory and being 25 or so years ago I could be wrong.

Its possible that the service notes may still be in
the Eimac archives. They do have some stuff on line at
whatever they are called now. I am a little skeptical about
the filament alone being able to absorb residual gas in the
tube but some filaments, in particular thoriated tungsten do
need to be run when emission is low to allow more thorium to
percolate to the surface. This may be something else
entirely.
Much gas in a tube will "poison" the filament causing a
severe loss of emission. Gas in general causes ionization
in the tube which allows conduction in a different manner
than electrons in a vacuum. Part of Eimac's success was the
knowledge of how to produce really hard vacuums.
As far as electrolytic caps go, there is a military
handbook which has a procedure for re-forming electrolytic
caps. It does require some time. The basic procedure is to
set the cap up on a variable DC power supply with means of
monitoring current. A good cap will come up with rather
high charging current which will fall off within a few
seconds as the cap becomes fully charged. The residual
current is the leakage caused by incomplete insulation of
the dielectric. This is normally higher in an electrolytic
cap than in other types. If the current does not fall to a
low level after a reasonable time for charging the
electrolytic electrode may need reforming. The voltage is
set low and allowed to sit there while the leakage current
is monitored. If the cap is reforming the leakage will
slowly fall. As it falls the voltage is increased.
Eventually, if the electrode does reform the cap will have

acceptable leakage current at full rated voltage. Of course
the capacitance should also be checked because it may have
changed due to whatever happens to the electrodes.

From -

"A History of EIMAC" Jack McCullough, ca 1974

"Tantalum was a different story. Eimac and H&K before it, had developed their reputations on tubes
that could 'take it.' Tantalum was the material that made this reputation possible. There was
something we had overlooked. Tantalum was a great getter when it was red hot; a lousy getter when
it was cold. Here was a paradox. Those customers that 'beat' their tubes thought Eimac tubes were
the greatest, but those customers that ran their tubes conservatively got very poor life. In the
search for long life, we finally eliminated all tantalum in our tubes. We substituted molybdenum,
coated at first with pure zirconium powder. Later we developed more rugged coating called Pyrovac
that was the best of both worlds. We still use Pyrovac in our tubes."

So I'm 50 years behind, so what else is new??

From: Garey Barrell
Topic: 11347 Message: 11354

Curt -

Performance is quite similar. Both are essentially the same design, with the 2-B having one less
conversion stage. The 2-B has crystal controlled converters ahead of a 3.5 - 4.1 MHz (VFO) tunable
1st IF, a 455 kHz 2nd IF, a 50 kHz IF with Passband tuning w/ 0.5, 2.1 and 3.6 kHz bandwidths,
Product Detector and Audio stages. All tube circuitry.

The R-4 has a crystal multiplied/PTO to a 1st IF of 5.645 MHz, a 455 kHz 2nd IF, a 50 kHz IF with
Passband tuning w/ 0.4, 1.2, 2.4 and 4.8 kHz bandwidths, Product Detector and Audio stages. All
tube circuitry.

So identical from the 2nd Mixer on, with the only 'real' differences of linear PTO tuning, one more
IF bandwidth, a Noise Blanker instead of a Noise Limiter, a Notch Filter and interoperability with
the T-4X transmitter.

Neither is intended for 'high fidelity' AM, with a sort of 'exalted carrier' being the only practical method. The 4.8 kHz bandwidth IS a little better for coming closer to the 5 kHz sideband
response of commercial AM, at least in the US.

It's a crap-shoot. If you can bring old caps up gradually, you can keep them running for quite some time. I've done this with radios from the 1930's in the past.

Having said that, I will gladly sub in new caps in an antique radio while leaving the original cans visible from above. New caps are so cheap and so small that it's fairly easy to do most of the time. In the case of a REAL HV supply, though, I would look towards trying to re-form the caps in the L-4 supply but start lining up sources for replacing all the caps in the HV supply just due to the voltages involved. You might be able to milk a couple years out of them but the time will eventually come...

Six bucks for a 6EV7 is a really good deal.

From what I've read, you do have some sort of issue with transmit control and it's conceivable that a gassy 6EV7 could be the source of your grief.

Subject: Re: [DrakeRadio] Re: T4XC Problem

Well, did a few things today. New 6EJ7, and replaced R114.

According to the counter I have 12.645Mhz getting to C29. Akso seeing it on the "bottom" pin of T3.

However, the grid and plate of the 6AU6 mixer seem to show the 5.645 freq. Note: Counter is an old Yaesu YC500 with input impedance of 1Mohm.

I tried another 6AU6, with no change. I checked the resistance of the T3 secondary, it's about 2 ohms.

I do see a little increase in plate current above the bias setting at 7Mhz, but see a bigger increase at the 5.6Mhz.

While in there, I did do the resistance and voltage checks, which, like you I don't totally rely on them, but they were close enough to the table to tell me it looks like the circuitry is intact. At one point I did try a new driver tube and finals too, with no change.

One interesting thing I noticed is with the "Transceve" switch in "recv" the PTO light does not go out. Not sure how (or if) that is connected to this problem, but I did notice that the 16MHZ crystal freq does go away, so probably something in that particular curcuit.

So, still not there, but looks to me like it is something happening in the mixer stage. I will do some more "poking" later.

The CD sure has been a help identifying where parts are. That was a good investment!

Thanks again for the help...

OK, stupid question time: I have a Drake L4-B that has been sitting for several years, and I want to bring it back on line. I think it would be prudent to simply replace all the caps in the HV supply, but the manual isn't handy at the moment (I do have one, somewhere).

So, what size are the caps, both electrically and physically? I will buy some new ones from Mouser or a similar place, but need to be sure I get the correct ones. Physically smaller is of course OK, as long as the electrical ratings are sufficient, and I know that modern caps are substantially better, so replacement seems prudent.

Second, the plastic blower wheel (the squirrel cage) is warped and in need of replacement. The motor is fine. I would prefer a metal wheel, but a good plastic one would do. Sources and make + model number info please?

> So I'm 50 years behind, so what else is new??

Pyrovac is the stuff. I think tantalum was still used
for grids in some tubes because it has very low electron
emission.
Tube manufacture is amazing; all sorts of specialized
knowledge in many areas; metalurgy, glass technology,
machining, etc. The glass must be heat and strain resistant
and preferrably not adsorb gas on it surface or outgas. I
think Eimac used Nonex, a high termperature glass with very
low thermal cooefficient of expansion (Nonex= Non
Expanding) The reason is that the glass can get very hot
during use and can strain the seals causing cracks. Tubes
can develop micro-cracks that will allow air to get in over
time. Bill Eitel and Ralph Heintz were pioneers in
transmitting tubes as was Charlie Litton, who developed the
glass lathes used by all of the power tube manufacturers and
was responsible for the practical manufacture of the

Magnetron tube. These men, along with the Varian brothers
and Bill Hewlett and David Packard laid the foundation for
Silicon valley.

> <www.k4oah.com>

FWIW AM broadcast stations are supposed to have good
response out to at least 10Khz. Current practice is to limit
response to 12 khz to prevent monkey chatter from highly
boosted high frequencies. Most modern broadcast
```

transmitters will modulate out to 15 khz and even very old ones were good to 10 khz. The main problem is the disgustingly bad audio fed into them. Broadcasters use far more processing than was ever used on transoceanic communications circuits. They want the modulation meter to sit at 100 even when there is no signal. Almost the only place one can hear reasonably good audio on an AM signal these days if from some short wave stations.
Actually, FM is not any better because most FM stations also use excessive processing.
My hearing has deteriorated to the point where I can no longer judge hi-fi but I can still tell how clippy and distorted most AM signals are.

BTW, the idea that AM stations were limited to 5khz probably came from the use of 5khz or less wire lines for network transmission. I think NBC may have used 8k lines in its grand days but am not sure.

For some years now the FCC-required NRSC curve for AM stations cuts off response at 7.5 KHz, and more recently Clear Channel ordered its hundreds of AM stations to cut off everything above 5 KHz to avoid interference to the disastrously bad AM "IBOC" digital signals which no one except radio's corporate masters want. It hardly matters anyway since other corporate masters had already decreed that receivers reproduce hardly any more than telephone-quality audio on the AM band. We old-style hams with boatanchor receivers are the only ones left who know how good AM can sound, and no one else cares.

thanks everyone for their input. Lots of great ideas.

Went through the PS checking primary voltage setup to make sure it is set for 220VAC. All good. Much to my surprise, the PS has been upgraded with all new caps, resistors, and diodes.

did have a problem with the power switch being stuck in "ON". Used the rebuild procedure from WB4HFN site. Cleaned up the contacts in the switch. Working excellent.

Finalized the hookup to the C line with the relay cable, AGC line and coax. Having never operated amp before, the tune and operation procedure required study of the manual -:)

surprised by the amount of glow from the tubes! makes for pretty site. Feeding amp with 80 watts key down, produced a solid 600 from the amp. did not want to drive it hard just yet. Happy with the results!

Still have a mic audio issue. have not tested the mic amp (12AX7A) yet, but will. Using Astatic D-104 with fresh install of element from RBmicro. Mic works great with TR-4C plenty of audio, just not much audio drive for the T-4XC. will fire up the L-4B when have the audio issure figured out.

FWIW, AM 740 out of Toronto still seems to have a reasonably decent sounding signal, they are also one of the seemingly few stations left broadcasting AM Stereo at night. If somebody on the list has means to actually analyze their signal on a clear night, (they are a clear channel 50kW station), I would be VERY interested to hear the results! I am in IL and regularly have Q5 copy... Aside from the occasional adjacent IBOC crap

11375. Introduction KC9UNL

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-14 19:51:01 UTC
From: curtstamp
Topic: 11375 Message: 11375

Glad to join the group. I have just purchased a Drake 2B. Always wanted one of those receivers. I was first licensed in 1968 but let my license expire in the late 1990's. Since retired got the "bug" again and got re-licensed in 2011. In my last years of operation I had a Drake TR4C, R4C,T4XC. What great radios. Got a Icom 703 and a 718.
Don't have a lot of room in the condo, but would like to get a transmitter to run 50 watts for CW. I operate all modes but mostly CW, PSK31, and JT65.
Hopefully will learn more about the Drake equipment from this site. Also like to read about the older rigs and collect advertising and magazine articles.

73's

Curt

Curt -

Welcome tothe group. The 2-B was one of the best receivers made by Drake, and while a bit of a
'minimalist' implementation, it can hold it's own with many modern receivers.

We used to sell the 2-B by tuning in a CW or SSB signal, then lifting the front of the receiver a
couple of inches above the table and dropping it. The 2-B was the only radio of the time that would
'boing' and come right back to where it was. Very impressive in a day when you couldn't walk across
the room with the 100 pound 'rock solid' Hallicrafter's would 'boing' with each step! :-)

The 2-NT would be a good, small CW transmitter that would work well with the 2-B, including SIDETONE, MUTE and ANTswitching capabilities. Another nice 'match' that I used in the 60's was the
Heath HX-20, a good size and shape match.

11377. Rubber Feet for Drake SW-4A

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-15 02:25:13 UTC
From: w5ida
Topic: 11377 Message: 11377

Does anyone have a source for the hard rubber feet used with the SW-4A SWL receiver? These are the same black rubber feet used with many pieces of Drake equipment. I have an SW-4A which I obtained with the feet missing, probably because it was rack mounted and removing the feet saved rack space.

Any help will be appreciated.

John, W5IDA

Hi John,

I have replaced some rubber feet with the Radio Shack version and if they don't match, I replace all of them so the are all the same. They are fairly cheap and available.

John,

Go to www.wb4hfn.com, look on his Drake page and you will find directions to several parts suppliers. One carries knobs, feet, etc to replace what was originally there. There are also MANY articles of interest on different Drake products.

Have the option of power up the L4-B with the panel power switch, or, use the C-4 Powermaster and leave the L-4B panel switch in the ON position. Have already gone through the power switch to repair arcing issues, plus the fact it was stuck in the ON position. Comments please? I use the C-4 to power up the C line already. Consensus on any side effects on powering up the amp as well? Seems to me the power inrush could be better handled by the contact in the Powermaster.

The contactor is the way to go, Wayne. You just have to decide if you want the amp on every time you power up the station. If not, I would set up a secondary contactor powered by the power controller that you could switch separately.

Whatever you decide, always power the amp up in CW mode. The inrush is much lower than with the amp in SSB mode.

11387. Low audio drive in T-4XC

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-16 12:24:40 UTC
From: k5fex
Topic: 11387 Message: 11387

Using D-104 mic with new element from RBMicro. Audio drive in T-4XC is very low when compared to TR-4C and using same mic. Evidence of the audio drive is fact that power output when communicating with the T-4XC (as seen on the wattmeter, non PEP meter BTW). Meter reads less than 15 watts on vocal peaks with 100 watts seen on TUNE/Key down. The TR-4C peaks at 35-40 watts out with same key down output as the T-4XC. My suspicion is the 12AX7A mic amp. Don't have a new tube in inventory yet. Has been ordered and is on the way.

Any other suggestions or ideas?

My R4C is acting rather strangely on AM the filter in the AM slot is(Fox Tango model: YF-56H6.0, freq:5645, No. 226). When I switch the mode switch to AM there's no audio, and the S-meter is moving just fine so it's receiving signals. If the AGC switch is switched to OFF audio is present, but very distorted and weak. I recently cleaned the mode switch with deoxit D100L then a shot of deoxit sheild S5 don't know if maybe I screwed something up or not, but SSB, and CW work just fine. I recently purchased this R4C so I don't know if AM ever worked or not never checked it before.

Hi Wayne,
Your TR4C runs more power input than your T4XC, the PA has 3 tubes instead of 2. So it gives it about
30% more power.
With my voice, I get about the same 10-15w on avg.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-16 15:05:36 UTC
From: Garey Barrell
Topic: 11392 Message: 11392

Richard -

Quoting Jim, "as Garey said, transceiving on CW is a bad idea."

I believe Richard made a key statement. "From 1972 until the 80's I worked Heath SB 303/401 then the
Drake. I never had trouble with tranceiving cw or ssb on any rig and being close on frequency." The
reason this statement is 'almost' true is that essentially all the US made, tube based 'twins' sets
used the LSB position for transmitting CW.Coincidentally(?) this is about the time the solid state
rigs became competitive, and transceive became more of a way of life, EVEN on CW.

IF you set your Passband tuning or SIDEBAND selector for LSB reception, the system worked OK, with
the only variation being the ability of a particular operator to 'match' his tone to yours. OR his
willingness to accept YOUR choice of tone frequency. Most good CW ops have a preferred tone
frequencyor range, and most prefer considerably less than the ~1 kHz typical offset. So even at
best, transceive operation on CW was less than optimum.

The bottom line is that two stations in transceive _MUST_ be on _different_ frequencies! They
must be separated by the audio tone preferred by _TWO_ operators, and they may each be separated
in _TWO_ directions! This leaves us with several possible combinations, resulting in at least
eight (8) possible situations, i.e., either you're separated by the same amount in the same
direction, or up to twice as much in opposite directions.

I don't know why some manufacturers offset their CW signal toward USB, but they do, and therein lies
the rub. I don't know which way the TR-7 offsets, but I suspect it will be LSB. If so, then
setting your Passband tuning for LSB CW will get you close to other stations _who use USB for CW
generation_, but leave you twice the audio frequency away from those miscreants who insist
on using USB!

From 1972 until the 80's I worked Heath SB 303/401 then the Drake. I never had trouble with tranceiving cw or ssb on any rig and being close on frequency.
>>
>> I have the original instruction manual which I have read concerning CW xmit /rec operation. The manual states if you tune to zero beat his signal you will transmit where he is listening as he is offset normal cw pitch 700 Hz. Of course if I stayed zero beat then I will not hear him. The manual goes on saying to tune the TR7 to the 700Hz pitch and go to it. Meaning the other end would hear me at 7.065 (dial). Case in point ....I xmit with my Yaesu 847 on 7.065 (Dial) and I zero beat the TR7 at 7.065 (his carrier is 7.065) so to hear him I must tune down to 7.064.3 on the TR7 (for 700Hz. receive pitch). The manual says xmit from 7.064.3 and I will be where he is listening. When I transmit from that frequency I am not on his original dial tuned frequency of 7.065 but 1Kz higher his or my FT847 dial. So if I tune the TR7 down to 7.064 (1K below the original zero beat the FT847 now hears the 700 cw pitch but if he transmits back
>> again the The TR7 now hears a 1000Hz pitch.
>> If I leave the TR7 main dial at 7.064 and use RIT +300Hz. to where I hear him at 7064.3 it tranceives perfectly.
>> To me that means the TR7 CW oscillator or carrier TX offset adjustment circuit is not set for the 700 Hz offset but is 1K offset.
>> As I originally stated the guy that renewed rebuilt and alligned the TR7 has highest credentials on Drake radios from everyone on-line, still I can't believe any rig should be this hard to meet a calling station. Because of the hassle I've let my great TR7 languish on the desk and seldom using it

On 1/16/2013 10:05 AM, Garey Barrell wrote:
> I don't know which way the TR-7 offsets, but I suspect it will be LSB.

For the TR7, it's USB. For most modern transceivers, two CW "modes" are used - UCW and LCW (!). In any case, the transceiver adjusts the offsets and BFOs accordingly and no matter which CW mode you use, you'll be on the right frequency. I agree on the problem with two operators using different offsets and the resulting slight differences in frequency.

That was always one of the strengths of the TR7 - you could simply use the passband tuning to peak an off-frequency calling station without having to use the RIT. In a contest, I could never remember to reset the RIT once tuned off center, but having the PBT tuned off of your normal listening offset is immediately apparent from the pitch of the background noise heard.

While transceive operation may not be the ultimate for CW operation, a CW contester today would not fare well by not using transceive mode.

From: John King
Topic: 11377 Message: 11395

Thanks to all who responded to my request for information on cabinet feet. Many of you suggested ways of obtaining adhesive-backed, domed feet like the part whose URL appears below.

However, the feet on the SW-4A are cylindrical and held in place by a machine screw through the foot and cabinet and a nut on the inside of the cabinet. I would guess the feet to be about 3/4 inch in diameter and perhaps 1 inch in length. If someone knows where to get these feet, I would appreciate that information.

Thanks,

Dave -

Check filter, replace with ~hundreds ohm, 2W resistor between hot leads.

Verify that 5595 kHz 3rd Mixer LO is running.

Q6 is AM Detector, Gets +10V via S2A (Front)

The ¼☐ diameter rubber pieces fit on the bottom of the feet you are describing. Both can be found at Nationwide Radio & equipment Sales. I☐ve purchased both parts from them.

Subject: RE: [DrakeRadio] Re: Rubber Feet for Drake SW-4A

Thanks to all who responded to my request for information on cabinet feet. Many of you suggested ways of obtaining adhesive-backed, domed feet like the part whose URL appears below.

However, the feet on the SW-4A are cylindrical and held in place by a machine screw through the foot and cabinet and a nut on the inside of the cabinet. I would guess the feet to be about 3/4 inch in diameter and perhaps 1 inch in length. If someone knows where to get these feet, I would appreciate that information.

Thanks,
John King, W5IDA

Check around Q-6 and CR-4. This is the AM detector. Its
could be a bad diode or transistor but its not a complex
circuit.

Wayne -

Have you turned up the GAIN control? Whistling into the MIC should produce the same output as TUNE
mode.

The 12AX7 generates the TUNE mode signal, so doubtful that the tube is weak.

Evidence of the audio drive is fact that power output when communicating with the T-4XC (as seen on the wattmeter, non PEP meter BTW). Meter reads less than 15 watts on vocal peaks with 100 watts seen on TUNE/Key down. The TR-4C peaks at 35-40 watts out with same key down output as the T-4XC. My suspicion is the 12AX7A mic amp. Don't have a new tube in inventory yet. Has been ordered and is on the way.

Conceptually, yes. Here's how I'd approach the problem - there are other ways, including use of a Softrock receiver, but this is what I prefer:

1. Obtain the first IF signal (believe that's 5.645 MHz) via a tap before any filters and use a Clifton Laboratories buffer amplifier kit mounted inside the R4B near the tap.

2. Contact N8LP and ask Larry if he can provide the parts or values for his LP-Pan unit to be able to handle the 5.645 MHz input (I assume this is possible)

3. Obtain one of the recommended sound cards that work well with LP-Pan - that will allow you to see up to 192 KHz of the band in one sweep - that's a lot.

4. Obtain the free NaP3 panadaptor software that works with LP-Pan. That will provide all the panadaptor function including waterfall, etc.

Since there's no way to obtain frequency information from the Drake, you'll end up with NaP3 showing you the entire IF bandwidth and you'll have to play with NaP3 to determine exactly where the center is. After that, you can configure NaP3 to show the frequency as plus and minus offsets from that center. You'll be able to zoom in from the 192 KHz width to as little as 1 KHz.

You'll be tempted to use other software approaches and they're all inferior to NaP3 for the panadaptor function.

If the LP-Pan can't be adapted to the R4B IF frequency, another equally good approach (but more expensive) is to use an SDR-IQ receiver from RF-Space along with its companion software. The SDR-IQ will handle the Drake IF frequency just fine. I can't recall whether or not you can configure the software to show you plus and minus offsets from the center. You could get the software ahead of time and check that out.

Another approach (cheaper) is to use one of the Softrock receivers. If you don't mind spending the time to get and keep all the associated pieces running properly, this might work for you. If you want a solution that works better and doesn't require ongoing effort, use one of the other approaches.

73, Floyd - K8AC

Bob -

Certainly. Floyd has done an excellent description of the 'Mercedes' approach that will 'almost'
plug and play. Unfortunately, it ends up costing more than you paid for the B-Line! :-)

Depending upon your interests, skills and financial situation, you might consider that basic layout,
except substituting the $20 (twenty) Softrock single band receiver in place of theLP/Pan. This is
still a kit, and is available with a crystal for your specified IF.

<http://www.wb5rvz.org/>

The preamp in the R-4B is a good idea, but the system will work without it 'almost' as well. I'm
sure there are other weaknesses in the Softrock approach, but assuming you have a decent computer it
will give you at least a 96 kHz wide panadapter for a LOT less investment. Stretching that 96 kHz
b/w to 192 kHz will almost certainly require a new sound card ($100+) for most computers, and do you
really need to know what's going on more than 50 kHz away from your frequency.

So if money is no object, Floyd's system is terrific and will work with very little effort. The
Softrock approach will ALSO work quite well, but with a little more effort, (and learning!) There is
some small toroid winding, and surface mount components involved, but I'm 70 and my hands are quite
shaky after my last 'hospital experience', so pretty much anyone can do it. I solderentire boards
at once with an 'embosser' heat gun from Michaels craft store. Some use an electric skillet or
toaster oven.

Of course you could just get the $70 1.5-30 MHz continuouscoverage receiver kit from Softrock and
dispense with the R-4B. The 'Ensemble II' does NOT have a front end that will stand up to contest
QRM, but in today's uncrowded bands it does quite well.

From: JD Reich
Topic: 10991 Message: 11407

Good Morning Glen,

Sorry for the delayed response; have just gotten around to testing. Thank you for your help thus far; this is my first time working on this Drake, so please bear with my ignorance, i.e, capacitor C79. :)

I tested the ac-4 and am getting proper voltage to all pins

I put in the new a02 tube, and am getting 149.9 voltage to pin 1

The tubes, v1, v5 and v13 are warm and have a slight glow.

Some history; I put a new coax input on, however the inner metal sleeve was too long, shorting out with a wire just inside the rig, behind the coax input, I believe putting the rig into transmit; by the time I realized this, it was 30-40 seconds so unsure if this might have caused a problem. I was getting receive after this however.

I also attempted to tune on AM using a keyer, but hindsight, I don't believe I had the correct adapter for the key to match this Drake; perhaps that shorted something?

Prior to this night, it was receiving and transmitting fine; with the exception of a bad so-239 input was gave intermittent and scratchy receive at times. It would also have low transmit after some transmissions, which is why I replaced the c5 in the ac-4. Other than that, it was tuning up and receiving.

Now, I cannot get receive or power out.

The finals all have a glow to them.

Any suggestions on the next step?

thank you

Can't quite agree with all that. N8LP has done a superb job with LP-Pan in getting rid of all the situations that cause phantom signals on the panadaptor display. If all you want to do is see things wiggle on the screen, then the cheaper approaches will work.

I agree that 192 KHz isn't used all that much, but, if the approach doesn't have that bandwidth, that's the first thing guys complain about. There are other problems with cheap or built-in soundcards, like a phantom spike exactly in the middle of your passband, just where you will often be looking. Nothing wrong with starting out with the Softrock approach - that's what I did. But, the other approaches result in a first rate result.

Whatever you do, you will still need the Clifton Labs buffer amp (it also performs an isolation function, keeping outside stuff out of the receiver IF strip) to prevent your tap from affecting the IF signal level. And - you can still use NaP3 (free) which is derived from PowerSDR by FlexRadio. No matter what one things about Flex, the PowerSDR approach to a panadaptor is excellent. That leaves the LP-Pan and a decent sound card. I often see the pair advertised on QTH.com for $200 or less. If that doesn't work out for you, you can always sell it for what you paid for it.

A lesser soundcard will likely also result in a non-linear baseline for the trace. In other words, the baseline, instead of being nearly flat, may have a hump in the middle or tilt from one end to the other.

No matter how you approach it, it should be a fun experiment and worth doing.

JD -

OK. Let's try again.

Confirm that slide switch on left side near rear is in 'TCVR' position.

Always tune the transmitter in X-CW position, with filter switch set to 'X'. A key is not necessary
and should NOT be plugged in.

Switch from SSB to X-CW with XMTR GAIN at 0 and see if you get 0.1A of PLATE current. If so, then
increase XMTR GAIN to about 10 o'clock and adjust RF TUNE for an increase in current, then quickly
dipthe PLATE control for minimum current.

If NO PLATE current when you switch to X-CW, with XMTR GAIN at 0, PA circuit is not complete and
will need further troubleshooting.

If PLATE current does NOT increase when XMTR GAIN is increased, then one or more oscillators are not
running, or alignment is seriously maladjusted.

DeoxIT or alcoholif that's all that you have applied to a strip of heavy paper, file card or
business card drawn through relay contacts may help. The contact on top, just to left of center, is
the Receive contact. Insert paper and slowly withdraw. Card will probably show black stripe.
Continue until stripe no longer appears.

Floyd -

I'm not disparaging the LP-Panor the rest of your description at all. Definitely the first class
approach that will result in a very nice system.

However! (There's always a however...) The last time I looked at the LP-Pan it was $250 by itself.
I think the preamp was another $30.''

The center spike can be offset to either end of the passband, eliminating the ~$100 for a decent
sound card, again at least to start.

I must say that seeing the LP-Pan / soundcard pair advertised for '$200 or less' is a bit disturbing?!? Dis-satisfaction, disappointmentor boredom?? Makes the $20 Softrock approach seem a
little more desirable! :-)

Again, I'm not saying that the LP-Pan isn't a 'better' way to do it, just a much less expensive way
to 'try it out' to see if you really want/need it.

I'm a contrarian in that I get my kicks out of putting the pieces together and making it all work.
But once it's all together, (and usually available as a package from HRO,) I lose interest! :-) I
was one of the first four stations on packet radio in Atlanta a bunch of years ago, but once it was
all kitted up and all the repeater networks were active, I quickly lost interest.....

> Can't quite agree with all that. N8LP has done a superb job with LP-Pan in getting rid of all the situations that cause phantom signals on the panadaptor display. If all you want to do is see things wiggle on the screen, then the cheaper approaches will work.
>
> I agree that 192 KHz isn't used all that much, but, if the approach doesn't have that bandwidth, that's the first thing guys complain about. There are other problems with cheap or built-in soundcards, like a phantom spike exactly in the middle of your passband, just where you will often be looking. Nothing wrong with starting out with the Softrock approach

- that's what I did. But, the other approaches result in a first rate result.
>
> Whatever you do, you will still need the Clifton Labs buffer amp (it also performs an isolation function, keeping outside stuff out of the receiver IF strip) to prevent your tap from affecting the IF signal level. And - you can still use NaP3 (free) which is derived from PowerSDR by FlexRadio. No matter what one things about Flex, the PowerSDR approach to a panadaptor is excellent. That leaves the LP-Pan and a decent sound card. I often see the pair advertised on QTH.com for $200 or less. If that doesn't work out for you, you can always sell it for what you paid for it.
>
> A lesser soundcard will likely also result in a non-linear baseline for the trace. In other words, the baseline, instead of being nearly flat, may have a hump in the middle or tilt from one end to the other.

Thank you Garey,

I did confirm that the switch was switched to TCVR; it was and I switched it back and forth; this was working prior to these problems.

I did get a 0.1A plate current, but when I increased XMTR gain, the current remained at 0.1a on 80, 20.

I also cleaned the relay contact points with DeOxit, and they were a bit dirty, but this did not help this particular problem.

As far as the oscillators go, to determine if they are running or misaligned, what would the next step be?

thank you again and 73

JD -

I think we better check the +10V bus since you had 0A2 troubles.

Socket V20. There is a power resistor hanging on the side of the socket turret of V20. The terminal
at the 'top' with the resistor lead and the Wht/Red wireshould read about 11 VDC.

I am presently using an eico 722 with 2nt, works great. i prefer
the xtals as using the vfo i have to throw its switch from xmt
to rcv when going from r4a/2b to 2nt. recently paid bit over $150
for it, but that is pretty much the going price.
also use the vfo with my ht-40,
jim

Garey,

You are bringing back memories with the early packet stuff. A friend and I got the GLB packet controller (maybe a kit?? I don't remember) from Hamtronics back East, and used them with our old Motorola Compa Stations so I guess we were the first packet fools down here in Southern Oklahoma. Was that the PK-1 maybe??? Anyway, we had built the GLB synthesizers for our rock bound Motorola's, then found these "new fangled" packet machines. We had been on RTTY on 146.70 for years by then. Lots of fun, but as you said, when it got crowded, we moved on to sending Wefax across the state, hi.

Good old days.

Don, WB5HAK

Hi Garey,

I tested and got a reading of 105v from the top of the resistor where it connects to the terminal. This was using the positive lead of the multimeter to the terminal/top of resistor to the other side of the resistor where the white and red wire was soldered having my multimeter set to 200, measuring volts dc. The white red wire did look a bit brown/scorched where it was soldered to the resistor.

I hope I'm doing this right, and again, thanks for your guidance and patience.

JD

If I was getting paid by the hour, I'd make more flipping burgers, but I wouldn't enjoy flipping burgers as much as rescuing a Drake radio from oblivion!

"Krusty", the T-4XB with a "chassis complexion problem", went back together late this afternoon and I fired him up in tandem with my "regular" R-4B. There was no smoke, no theatrics and everything was working great on 20m.

I checked all the RF stages and peaked them using the "detune" method on the INJ stages and regular peaking on the drivers.
Neutralisation was spot-on.

Checked the filter match and it was pretty much where it should have been. C2 was a bit of a tougher nut to crack, but once I remembered to centre the PBT to get equal signal strength readings when closing the PTT in SSB and adjusting for equal levels I got that knocked, too. It's DEFINITELY easier to use the unmuted receiver to adjust the carrier balance, filter match and frequency alignment!

Wattmeter indicates well over 150W on 80, falling to 100W on 10 with over 400 ma plate current. I did try it but don't like to push these on 10 anyway.

The front panel and knobs are in great shape. It has the original blue filters that are still blue! This is another reason I think this had low hours.

I bought this with no top cover, so the one I've put on ain't the prettiest one on the block but is certainly useable with no extra holes or excessive damage.

It's all aligned and cleaned! The corrosion on the chassis was removed after cleaning with a Dremel and wire brush, then I coated it with poly only where there were issues. Like I said, it looks ugly on the inside but really nice on the outside and works perfectly!

Email me off-list if you're interested. I'll get pics ready over the weekend. Shipping weight for these is right around 14 lbs and I'm in 27302.

Because the R4 series preselector is relatively narrow, and more noticeable on the lower bands, the baseline won't be flat like the screens most of us have seen when using a panadapter. If this effect won't be an annoyance, it's worth considering if using a high quality buffer amp like the type Floyd described.

From: Garey Barrell
Topic: 10991 Message: 11423

JD -

Check the voltage at the 'other end' of that resistor just to be sure. You should get about 11 VDC
on one end and 150V on the other end. The 11 VDC end is the supply for Q4 and the PTO. IF you
measure 105 VDC on the 11V end, the PTO and/or Q4 are blown. Do you have the Service CD yet?? Q4
is on Board 1. If it has more than 11 VDC on it, it's blown

This was using the positive lead of the multimeter to the terminal/top of resistor to the other side of the resistor where the white and red wire was soldered having my multimeter set to 200, measuring volts dc. The white red wire did look a bit brown/scorched where it was soldered to the resistor.

Good point! Probably a good bit less than 96 kHz anyway, negating the biggest advantage of the
sound cardupgrade. The 'zero peak' can easily be shifted off to one side or the other.

On 160m, just shift an R4's VFO +/- 20 kHz and observe the radical change in Rx sensitivity if the preselector isn't re-peaked. I've not used a TR-7 or R7 in over a decade but since preselection is fixed, I suspect the passband is mostly flat across each band as it is with most non Drake transceivers.

From: whitebear1122@...
Topic: 11399 Message: 11426

Jim, While I no longer have my 2NT and Eico 722, I only needed to switch the transmitter switch on the 2NT to mute the 2C receiver and enable the VFO. I never had to switch the transmitter switch AND switch the vfo. Maybe the 2NT/R4A receiver is different. I sure enjoyed owning that 2NT and 722 with the 2C. Great station. I sold it 2 years ago at the start of my major radio sell off. I have already sold about 75% to 80% of my stuff. 73, Scott WA9WFA

Subject: [DrakeRadio] Re: Drake 2NT with VFO Usage

I am presently using an eico 722 with 2nt, works great. i prefer
the xtals as using the vfo i have to throw its switch from xmt
to rcv when going from r4a/2b to 2nt. recently paid bit over $150
for it, but that is pretty much the going price.
also use the vfo with my ht-40,
jim

11427. Crystals go where

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-18 05:43:29 UTC
From: Tom
Topic: 11427 Message: 11427

I should read both manuals again, but if anyone knows:

I have extra crystals for my T-x4 and R-4, at 12.6, 39.1, 40.1 and 40.6 to cover the rest of 10 and 160.

If I'm tuning with the T-4x, just to receive at this point, do the crystals go in it, or in the R-4?

Feel free to smack me if that's a dumb question.

Thanks.

I believe some go in the radio the main ones others have a space on the back usually covered which you remove to put the crystals in.

Tom,

If you are using the transmitter as the controlling VFO, the crystals should be placed in the transmitter. If the reciver is the controlling VFO, the crystals should be placed in the receiver.

Tom,

Typically most people put them in the receiver. If these are indeed "extra" and/or you want to use the tx PTO put them in the area provided on top of the tx chassis. You'll have to remove the top cover to get in there. You can then use the crystals control in the lower right of the front panel.

It could be cool to build a modern circuit and house it in a castaway Drake chassis. Imagine building a flat-responding front end and putting the guts of something like an Elecraft P3 in it!

11432. Stopped transmitting

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-18 12:56:45 UTC
From: bobnohren
Topic: 11432 Message: 11432

Got my newly serviced Drake B-line back a couple of months ago and it was working fine. One minute I was tuning up, transmitted a couple of times, and the next minute, no reading on the watt meter and no hum from the linear. Switched to 'tune' all was silent , as usual, but no power out. Receiver never missed a beat and was working as usual. All lights are on. When I turned 'tune' back to ssb, it hung up in the tune mode longer than usual, then finally clicked back to receive.
Now what?

Bob N4IBK

PS Someone made mention of a service CD. Where might I get one of those?

Yes, we went back to HF autostart RTTY on 14100 kHz. Nothing like a 28 running at 100 baud! :-)
We started with homebrew TNCs then went to the TNC-1 from TAPR very early in 1982?

Did you have a TR-3 donor? If so, the "G" looking for ameter. He says both PLATE and S meters are
5 mA fs. Dowe know that??

11436. TR3 Parts

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-18 18:19:44 UTC
From: Don Cunningham
Topic: 11436 Message: 11436

Garey,

I too did some autostart on 20M, but I was not a regular there. I was very heavily involved in Navy MARS then and dedicated autostart on 2M with a BUNCH of locals. We even put up a couple of RTTY repeaters on a mountain to connect two active groups. You must understand that mountains are NOT high in Oklahoma, but a change from the flat land, and helpful for repeater sites.

I have no TR3 parts at all. The TR3 is one of the only Drake rigs I have not owned at one time or another!!! Most of what is left here in parts is what I bought when they closed things out online at Drake. I only wish I had bought more when the opportunity was there.

73, and thanks for all you do,
Don, WB5HAK

OK. I don't 'know' that the meters are identical. I know the '3 PLATE meter is different than the
'4. Nuthin's ever easy.

Memory is going, we were actually on 14.075. You may have been aware of NAVMARCORMARS CATC program
and the DT-600. The CATC concept was to automatically route RTTY traffic by call signs (kind of a
simple packet system), which is why our MARS call suffix was the same as our FCC calls, i.e., N0OAH.
The DT-600 was my rework of the ST-6 Irv Hoff designed. We spent HOURS with me trying to convince
him of the advantages of single board construction (think TR-7 / DeoxIT!) over his plug-in card
system. He was just too enamored with the plug in card idea! So I developed the DT-600 just to show
him it could be done. (Stubborn, ain't I?) Bob Scalf, K4EID saw it and wanted it for CATC. Archie
was the digital guy, and Bob Clark was the writer for the article. Archie developed a 'sorta'
functional digital board, but I don't think ever had a reproducible system. There was some demand
for the DT-600 from an article published in Ham Radio magazine, so Bob Scalf's brother in Miami put
together some kits that he sold fora while.

Date: 2013-01-18 19:30:20 UTC
From: Don Cunningham
Topic: 11436 Message: 11438

Oh, yes, I remember the DT-600 very well. I probably built 10 or more of them for "building impaired" MARS members, hi. That unit (toroids properly tuned) is undoubtedly the best TU I have ever used. It is even better than my present ST-8000 HAL unit, IMHO. I have two of the DT-600 commercial board units that I need to check out, re-cap, and get back on RTTY. I didn't participate much in CATC, as I was busily paying for a business a ham friend and I got into. After deciding that wouldn't provide the living we both needed, I got my Master's degree and went back to education. All that work/schooling sure cut into my time for hamming.

I got back into active MARS during Desert Shield/Desert Storm with a packet BBS that turned into Pactor, etc (MDS system). I did some of the evaluation of HAL's Clover system on Navy MARS frequencies using boards Navy MARS provided from HAL to enhance our BBS setups. Clover was difficult for many to use, but I thought it was a neat concept for message handling. I took traffic from Hawaii and other WESTPAC on a 16 meg frequency and put it on 2M to a couple of other stations in Oklahoma to put on 5 and 7 megs for distribution. Neat system, but a full time after hours job for the three of us, hi. I was made an Associate Member for that work, and "retired" from active MARS work.

Okay, I digressed from Drake, but all this started first on Drake 4 line gear, then on my TR7, so there, I tied it in some.

I hope that Bob, G1EGL, finds his meter.

73,
Don, WB5HAK

I have a T4- R4A combo that is really crusty too but work ok. I didn't do much to clean the rust off the top since it has a lot of rust but got the big chunks off.. I will be looking forward to your pictures to compare them to mine. Maybe I should be taking more rust off, I didn't use any power tools to remove any rust since I didn't want dismantle both radios..I did take a little wire brush and some scotch brite to them. There were places that I could not get to very well. Doing more would have required substantial tear downs. Do you mean Poly urethane clear that I would normally use on wood to protect a finish or protect it from the elements??

Subject: [DrakeRadio] Krusty is Ready for Prime Time and is For Sale!

If I was getting paid by the hour, I'd make more flipping burgers, but I wouldn't enjoy flipping burgers as much as rescuing a Drake radio from oblivion!

"Krusty", the T-4XB with a "chassis complexion problem", went back together late this afternoon and I fired him up in tandem with my "regular" R-4B. There was no smoke, no theatrics and everything was working great on 20m.

I checked all the RF stages and peaked them using the "detune" method on the INJ stages and regular peaking on the drivers.
Neutralisation was spot-on.

Checked the filter match and it was pretty much where it should have been. C2 was a bit of a tougher nut to crack, but once I remembered to centre the PBT to get equal signal strength readings when closing the PTT in SSB and adjusting for equal levels I got that knocked, too. It's DEFINITELY easier to use the unmuted receiver to adjust the carrier balance, filter match and frequency alignment!

Wattmeter indicates well over 150W on 80, falling to 100W on 10 with over 400 ma plate current. I did try it but don't like to push these on 10 anyway.

The front panel and knobs are in great shape. It has the original blue filters that are still blue! This is another reason I think this had low hours.

I bought this with no top cover, so the one I've put on ain't the prettiest one on the block but is certainly useable with no extra holes or excessive damage.

It's all aligned and cleaned! The corrosion on the chassis was removed after cleaning with a Dremel and wire brush, then I coated it with poly only where there were issues. Like I said, it looks ugly on the inside but really nice on the outside and works perfectly!

Email me off-list if you're interested. I'll get pics ready over the weekend. Shipping weight for these is right around 14 lbs and I'm in 27302.

11441. Re: More on my TR7

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-19 03:38:14 UTC
From: Jim Shorney
Topic: 11392 Message: 11441

I had to draw this out on paper to get it right in my head. I think I did have the offset backwards. Here's the way it works as I think I see it, assuming PBT is off:

The center of the IF filter is 5645.0 KHz. In USB mode, the carrier is placed at 5643.6, allowing the upper sideband to pass through the IF filter. In CW mode, the "carrier" is at 5644.2, still in the USB area. This is your BFO, and this is why you listen to CW in USB mode. The CW transmit oscillator is nominally at 5645.8 according to info found in the block diagram in the service manual. This must be a misprint, because the math doesn't work out; that would give a 1.6 KHz transmit offset. The crystal is listed as 5645.0 in the BOM, which makes sense for an 800 Hz sidetone (5645.0 - 5644.2 = .8 KHz). If you tune down from zero beat of an incoming signal and go for an 800 Hz CW note, your transmitter will be on his transmit frequency. I think I've got that right now.

Perfect. Even Garey should love it. :D

Now, in order for this to work, you need to use the main dial, with RIT off. Once you have that 800 Hz offset dialed in, any subsequent tuning to avoid interference, change the tone, etc., should be done with the RIT or your other VFO (if so equipped). Don't touch that dial!. (I've been waiting to say that...).

The offset could be changed by adjusting the CW oscillator or the CW fixed passband pot. It would be a good idea to check the keying waveform if the CW oscillator is changed (or even if not). Floyd's great article on this subject is spot-on (so to speak):

11442. Re: [DrakeRadio] Drake TR-4 resistor

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-19 03:46:04 UTC
From: JD Reich
Topic: 10991 Message: 11442

Hi Garey,

I tested q4 and it had 12.5VDC on it; in the process of testing, I shorted
and released smoke on L-5. What would be a good replacement?

I will test PTO after I get it removed.

thanks
JD

11443. Re: [DrakeRadio] Re: More on my TR7

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-19 10:34:55 UTC
From: Keith Evans
Topic: 11392 Message: 11443

Hi Jim, and All,
I do not like 800hz sidetone for CW, So I adjust down the CW Tx Crystal using the Trimmer adjustment via the Key Jack on the back panel, as per the manual, to a more comfortable 500hz ish tone.
On rx, especially if using the narrow filter, I listen to any cw station, and tune it in to the tone I
prefer (500hz ish), I then peak the signal using the passband tuning control. The TR7 is then set, all I have ever done is then tune into a wanted stn and call, I have never been
told I am off freq.
Sadly most rigs are now basically LSB for CW, so the TR7 Dial doesn't indicate what a Rice Box will, but if you see a Cluster Spot, just apply the offset.
I was thinking of adjusting the Variable Pot, to put the RX in the LSB Cw passband, And see if the CW Tx Crystal will adjust enough with the trimmer, to put Tx into the LSB side as well, But its still on the To Do list.
At least then the TR7 would follow modern convention, ie the Rx tone increases as the rx is tuned hf.
FWIW

Subject: [DrakeRadio] Re: More on my TR7

I had to draw this out on paper to get it right in my head. I think I did have the offset backwards. Here's the way it works as I think I see it, assuming PBT is off:

The center of the IF filter is 5645.0 KHz. In USB mode, the carrier is placed at 5643.6, allowing the upper sideband to pass through the IF filter. In CW mode, the "carrier" is at 5644.2, still in the USB area. This is your BFO, and this is why you listen to CW in USB mode. The CW transmit oscillator is nominally at 5645.8 according to info found in the block diagram in the service manual. This must be a misprint, because the math doesn't work out; that would give a 1.6 KHz transmit offset. The crystal is listed as 5645.0 in the BOM, which makes sense for an 800 Hz sidetone (5645.0 - 5644.2 = .8 KHz). If you tune down from zero beat of an incoming signal and go for an 800 Hz CW note, your transmitter will be on his transmit frequency. I think I've got that right now.

Perfect. Even Garey should love it. :D

Now, in order for this to work, you need to use the main dial, with RIT off. Once you have that 800 Hz offset dialed in, any subsequent tuning to avoid interference, change the tone, etc., should be done with the RIT or your other VFO (if so equipped). Don't touch that dial!. (I've been waiting to say that...).

The offset could be changed by adjusting the CW oscillator or the CW fixed passband pot. It would be a good idea to check the keying waveform if the CW oscillator is changed (or even if not). Floyd's great article on this subject is spot-on (so to speak):

Thanks Garey. After a little troubleshooting, I found the 6ev7 tube to be faulty. Put in a new one and it's now functioning as normal.

Would over modulation from an amplified D-104 cause such a problem? That's the only thing I was messing with at the time.

When I email back, should it be to 'the group' or 'the sender' ?

Tnx for CD info.

Jim -

I think I have it. It's complicated, 'even for me'. :-)

So if a 'legacy' transceive station, with it's inherent 8-900 Hz_LSB_ offset comes along, the two
transmitters are going to be 1.6 kHz apart..?

The problem is these tiny filterbandwidths people use. If you're more than a couple hundred Hz
away, you might as well be on another band! Oh for the good ol days when IF's were 5-10 kHz wide..... But that's another discussion!

Jim -

Interesting. The Collector of Q4, the PTO supply, and one end of R140 are all tied together. The
Wht/Red wire from R140 goes toeither the PTO or Q4 Collector first and then on to the other. You
earlier said you measured 105 VDC on R140. One end will be 150 VDC, and the other should be 11-12
VDC, NOT 105. Something not right here.....

How did you smoke L5? It's on the other side of the chassis! :-) If it really is L5, we'll have to
get a replacement from a donor unit. Not a big problem, and it's only used on 15M. So when you get
it working on all but 15M, we'll know why!

11447. AC-4 PS multi conductor cable to TX

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-19 15:43:53 UTC
From: k5fex
Topic: 11447 Message: 11447

Anyone know a source for the multiconductor power cable? It is a 12 conductor cable with one of the 12 being a one wire shielded audio cable. Need to replace cable on PS.

Thanks,
Wayne

11448. Re: [DrakeRadio] Stopped transmitting

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-19 16:05:37 UTC
From: Garey Barrell
Topic: 11432 Message: 11448

Bob -

OK. No, there is no connection between an amplified D-104 and the 6EV7 failure. The 6EV7 is a
'power' tube, and they do get gassy after a while. There seems to be a rash of them lately, perhaps
they're all running down at about the same time! :-)

Adjust the GAIN control on the transmitter to about 10:30/11:00, then bring up the gain pot in the
D104 for about 10-15W output on peaks. The transmitter handles overmodulation pretty well, the ALC
is reasonably effective, but overmodulation is never a good idea!

I prefer that you reply to the List. This adds any information you contribute to the Archives of the
list, and will put a little knowledge book mark in some otherlist members.

Geez, Garey, you are asking me to *think* again. Without thinking too much, I suppose it could happen if both stations did everything wrong. It seems to me, though, that as long as your transmit frequency is reasonably close to zero beat with the other station's transmit frequency, he should hear you regardless of his offset.

11450. Re: [DrakeRadio] More on my TR7

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-19 19:13:33 UTC
From: Brenton Crowhurst
Topic: 11392 Message: 11450

I'm glad I'm not the only one who gets a bit confused about this.

But just when I thought I had it straight in my mind, I'm now confused about it.

I thought the transmitter was transmitting 800 hz higher than the receiver was listening, and that the digital display was giving the accurate receive frequency. With that understanding in mind, I was setting my RIT 800 hz high, and tuning cw signals to where there was no tone--is that called zero beat? -- then I'd turn off the RIT, and figured I was dead on frequency.

Do I have this wrong?

Thanks in advance to anyone who can help me get a proper brain alignment on this issue.

What I always did is this:
Tune in the other station so the pitch is exactly the same as your sidetone
(turn the carrier to zero; tap the key). IIRC, the sidetone is actually
made by the TX oscillator through the same conversion as the incoming
signals, so you're as close as your ear's pitch sense allows. In my case,
with a little musical training, that's within a very few cycles.

From: JD Reich
Topic: 10991 Message: 11453

Hi Garey,

I was looking at the 9-nb schematic, and was trying to test q-4 on this board which on my schematic was close to l5. Wow, am I making this worse! Certainly am being humbled, but I really don't want to have to give in and send it for repairs.

I retested r140 (this is the power resistor, correct?) and got a reading of 153.5 at the top (nearest tube) and 46.4 at the bottom. I followed the red-white to the PTO and am getting 46.4 there as well.

JD

T4XC - S/N 27704
R4C - S/N 26371 500HZ and 1.5KHZ filers XTALS added for 160, 30, 17, 12M
MN-2000 matching network
AC4 AC Supply
MS4 Speaker enslosure
W4 Wattmeter
Shure 450 mic wired for T4XC

Transmitter, Receiver and AC4 Supply recently refurbished by WA8SAJ Jeff Covelli. Supply had discrete caps and new diodes. Appears original inside. Have documentation to support work done. This is not museum quality gear, but is in excellent shape. Top of MS4 has a couple of scratches. TX and RX have excellent finish and front panels. All blue filters and diffusers replaced and white pointers on knobs repainted. All interconnection cables and manual reprints.

Asking $995 for all but will negotiate on price and could meet on Interstate 81 corridor in VA or elsewhere in Southeast.

Send email direct ni4z at arrl dot net and do not reply on this forum. Will furnish photos and phone numbers. I do not check this Yahoo address frequently so PLEASE email to above if interested.

Thanks,

Condy NI4Z
Alabama

11456. Re: [DrakeRadio] Drake TR-4 resistor

JD -

You really need my CD for the TR-4C if you plan to work on this radio. It's way too complex to
follow otherwise.

I've lost track of the s/n of your radio. I've got four of these 'projects' going currently and
they tend to run together!

46 VDC on the PTO is NOT a good thing.

On Sat, 19 Jan 2013 12:13:33 -0700, Brenton Crowhurst wrote:

>I thought the transmitter was transmitting 800 hz higher than the receiver was listening, and that the digital display was giving the accurate receive frequency. With that understanding in mind, I was setting my RIT 800 hz high, and tuning cw signals to where there was no tone--is that called zero beat? -- then I'd turn off the RIT, and figured I was dead on frequency.

That should work fine. Gary's suggestion also should work, it amounts to the same thing in the end. If you're working people, it's right.

11458. My C line station

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-20 00:00:13 UTC
From: Kevin Berlen, K9HX
Topic: 11458 Message: 11458

I had to jump on here a post a quick note. Recently, I have assembled
a station of C line twins. I have been a ham for 39 years, and have
wanted a set of these rigs
since I first saw them at a fellow hams house when I had my Novice ticket.

I have not been on HF other than for Field Day for many years. The
receiver was in good condition when it arrived. The PTO on the
transmitter was stuck, and
is now freed up, but will require more work to make it right. I
ordered the interconnecting cables, a Shure 450 desk mic and mic
connector. and put everything
together.

Today, with the help of my son, I constructed and put up a 20 meter
vertical. I assembled the rigs with all of the interconnects, ran the
antenna in and hooked
it up. To my surprise, I found the NA QSO Part in full swing. I tuned
up and cautiously went back to a station in New England, and got an
immediate return, and
the op made the comment "nice signal".

Just wonderful to have a set of these great rigs. I have several more
things to do. All the switches need a good cleaning, and I need to
touch up the alignment,
as received signals drop off about 2 S units when switching from the
RX to the TX PTO, and I need to sort out the stiff TX PTO. I also
have an AC4R power supply
upgrade on order as well. I would like to have had a casual
conversation and ask for a more critical signal report, but the
middle of a contest is not a good time
for this. There will be time for that later.

Thanks to all who make this list a great resource for these great radios. 73,

Kevin, K9HX

11459. Re: [DrakeRadio] Re: AC-4 PS multi conductor cable to TX

Wayne,

I did some looking too, thinking I had seen the cable. What I found was cable for the Drake amps (L4B and L7) from John Kriner. Search "tr7dude" on your search engine (no quotes, of course) and you will find his Ebay store. I would email him to see if he has a vendor. Also, Joel, of The RF Connection has some cable for the Collins AC supply, so an email to him might help as well. Other than that, no sources from here.
73, and let us know if you find a source!

Don, WB5HAK

Thanks Garey, I am doing that now. I originally thought it was simply the manual on cd, but now took the time to look and it certainly is much more! I'll order, acquaint myself and then get back to you.
Thank you again for the time you've taken in helping.

11461. WTB: 40 Meter Crystal for 2-NT

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-20 03:14:32 UTC
From: Darrell Bellerive
Topic: 11461 Message: 11461

I am looking for a 40 meter crystal to test a 2-NT transmitter. Anywhere between 7.002 and 7.083 MHz.

73, Darrell VA7TO

Hi
Going bacvk a few years had same problem on another make of rig. I finished up by getting some from a caravan (trailer) dealer. It is
used for connecting all the trailer lighting etc. to the car. Not sure about the screened audio lead though.
Cheers
Vic

Subject: [DrakeRadio] Complete C Line Station

T4XC - S/N 27704

R4C - S/N 26371 500HZ and 1.5KHZ filers XTALS added for 160, 30, 17, 12M

MN-2000 matching network

AC4 AC Supply

MS4 Speaker enslosure

W4 Wattmeter

Shure 450 mic wired for T4XC

Transmitter, Receiver and AC4 Supply recently refurbished by WA8SAJ Jeff Covelli. Supply had discrete caps and new diodes. Appears original inside. Have documentation to support work done. This is not museum quality gear, but is in excellent shape. Top of MS4 has a couple of scratches. TX and RX have excellent finish and front panels. All blue filters and diffusers replaced and white pointers on knobs repainted. All interconnection cables and manual reprints.

Asking $995 for all but will negotiate on price and could meet on Interstate 81 corridor in VA or elsewhere in Southeast.

Send email direct ni4z at arrl dot net and do not reply on this forum. Will furnish photos and phone numbers. I do not check this Yahoo address frequently so PLEASE email to above if interested.

Thanks,

Condy NI4Z

Alabama

Date: 2013-01-21 05:04:46 UTC
From: Ethan Blanton
Topic: 11447 Message: 11465

k5fex spake unto us the following wisdom:
> Anyone know a source for the multiconductor power cable? It is a 12
> conductor cable with one of the 12 being a one wire shielded audio
> cable. Need to replace cable on PS.

If it makes your buy easier, the factory cable does not have the
shielded audio cable inside the bundle. Instead, the cinch-jones
connector has two cables coming out of it, one multiconductor and one
short (maybe 4-6") shielded audio with an RCA female plug on it. The
MS-4 and RV-4 both have a shielded audio cable with a male RCA that
mates with it.

From: k5fex
Topic: 11447 Message: 11466

Yes Ethan, there is a 4-6" audio cable coming OUT of the CJ connector. And, YES there is a shielded single conductor INSIDE the bundle. The single shielded line supplies the transmitter AGC line for connection to the L4 series of amplifiers (or any other amp). The pigtail of which you spoke simply feeds audio out of the transmitter case. Check the schematic: pin 12 is the audio line and is the pigtail connection. Pin 3 is the AGC line with the shield of the cable connected to pin 7.

There is no mistaking a shielded single conductor wire and it is in the multicondutor bundle. Pictures can be posted if needed.

Therefore: looking for 12 conductor cable to replace the PS line from AC-4 cabinet to transmitter CJ connector. 11 voltage lines, 1 shielded audio line.

Drake 2B , cabinet needs painting. White dial face very good. VFO dial has wrong knob and is bent but can be fixed, just straighten. Receives but only on 75/80 meters , no drift nor hum(caps changed-ed) but not interested in working on this. Actually I think it just needs an alignment and the right crystals, 40 is missing.

This is an easy fix really. $95.00,offer or trade from 48626.

Topic: 206 Message: 11468

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

11471. R4A mystery resistor

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-21 23:26:07 UTC
From: qrper
Topic: 11471 Message: 11471

Gang...

I don't know why I keep doing it, but another Drake R4 ended up on my doorstep.

This one came in as dead, so it was no surprise when all I got out of it was a few clicks when I wiggled a tube or two in their sockets.

long story short, problem was actually caused by the factory. There is a 1K resistor connecting two sections of the metal filter cap together. From the factory, someone forgot to solder the one end. It was just crimped. The mechanical connection gave way, no B+ to the stages that need it. Broken radio.

Fixed that.

Problems that still lurk...

1. S-meter seems stingy. Yet, 50 mV moves the meter to S-9. I can easily hear a 1 uV signal.

2. There is a resistor that keeps going up in smoke. It's mounted onto a board right by the 6EV7 audio output tube. The schematic I have on the R4A shows it as a 150 ohm unit. The one that I took out looked like a 330 ohm, the last band is cooked to the point I can't read it. I uploaded a photo of the part.

3. calibrator signal is real weak. I've got plenty of output from the calibrator, 10 vpp, yet very little to the radio. Yes, I 've checked and replaced the small coupling capacitor but no joy. For all intents and purposes, the calibrator is working, but yet it's not.

Found a few tubes that were so-so and one with a high grid leakage. I stole a few tubes from another R4B, i saw no significant improvement.

So, any ideas?

Mike, wb8vge

Mike,

Is that tube designator of 6EV7 a typo?? That tube was used in the Drake transmitters as the keying tube, not audio output. I'm likely wrong, but I've never seen that use for a 6EV7.

Yes, that is R43, and should be a 330 ohm, 1/2W resistor. It is the decoupling resistor for the AF
OUTPUT stage. Depending upon which of the four versions of the R-4A that you have, it may or may
not have had C90D, the fourth section of the filter cap to ground on the downstream side. Obviously
a short here, or even just excess leakage could take out R43. Earlier versions didn't have that cap,
so would suspect the cathode bypass cap on the 6EH5 AF OUTPUT tube perhaps shorted, causing overcurrent.

Something drawing too much current, and R43 feeds only the AF OUTPUT stage through the output
transformer.

Hmmmm. Again, excess current through that stage.... Tube failure shorted, leaky coupling cap C174,
leaky C90D, all could present as destroyed R43.

My mistake; sorry. The only Drake PSU cable I've actually
disassembled was for an AC-3, which does not have the AGC line. I
didn't consider that it would not just be another pair.

When you say 'the pigtail simply feeds audio out of the transmitter case', is that audio to monitor voice modulation as transmitted or receive audio for an external speaker? I always wondered what that short lead was for. Thanks, Bob, NZ5A

The pigtail with female RCA jack on the transceiver end
is the speaker connector. I don't know why Drake did it
this way. When you use the rig with a speaker and power
supply the lead to the speaker can run along the PS cable.

The pigtail with female RCA jack on the transceiver end
is the speaker connector. I don't know why Drake did it
this way. When you use the rig with a speaker and power
supply the lead to the speaker can run along the PS cable.

Bob -

There IS a reason for the speaker pig-tail out of the back of the power supply cable. The original
AC-3 and DC-were designed for use with the TR-3 _MOBILE_ transceiver. With this arrangement, there
was only theCinch plug and the antenna lead to deal with wheninstalling or removing the radio. When
the T-4X transmitter came out, the first ones were delivered with the AC-3. There was no speaker in
the T-4X, and there was also no linear amplifier keying lead. The companion R-4 receiver had it's
own speaker jack and the pig-tail was no longer needed. So many of us rewired the speaker pig-tail
to an external linear amplifier switch by moving one wire inside the Cinch connector.!

The later AC-4 added the linear control switch in the cable, and the pig-tail was retained for use
with the TR-4/C speaker.

Thanks Garey. I suspected that was the case. The TR-4C I have was acquired with its matching AC-4 and MS-4. The AC-4 has TWO pigtails. One was color coded to match the speaker cable. To my discredit… I've not checked into the second pigtail to determine its use.

Ah, thanks Gary. As soon as you said that a vague memory clicked in my mind. Long ago (well, 1962) one of the guys in my Novice class was the first to upgrade to General. He was able to acquire from T. Frank Smith (W5VA) a 32V2 and a 75A2 for AM phone and a Collins speaker. He later sold the RX and TX and bought a TR-3 and AC-3. Made T. Frank mad.

Anyway he was the first guy in the class to get on SSB and with a newfangled transceiver at that. We all went over to his shack to see it and him operate kit. I remember he hooked up a large speaker to that little phono plug, if I remember correctly, and only pressed the PTT on the mic to transmit. Amazing! We didn't understand logically why he didn't have to zero beat or throw a T-R switch or how something so 'small' could put out a 100 watts.

How far has equipment come in some senses, since my S-85 and DX-20 and Dow-Key relay. In other ways, Drake equipment principles are still vital in many modern rigs.

Thanks for the explanation.

That was the 'other' approach. Allowed use with either the TR-4 -OR- the T-4X (any). Your 'second'
one is almost certainly the linear switch.

11490. TR7 FSK RTTY

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-23 20:35:19 UTC
From: aa5wg
Topic: 11490 Message: 11490

Hi to all,

Can the TR7 run FSK RTTY? If so, is there any good documentation on how to set up the FSK RTTY operation?

I have a Rigblaster Plus from West Mountain Radio. Could this be used with the TR7 for FSK RTTY?

Thank you,

Chuck - AA5WG

11491. TR7 FSK RTTY

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-23 20:50:14 UTC
From: aa5wg
Topic: 11490 Message: 11491

Is it possible to have both FSK RTTY and AFSK for other digital modes with the TR7?

Will the West Mountain Radio Rig Blaster Plus work with above two modes (FSK and AFSK)or is there a different or better way to skin this cat?

Thank you,

Chuck

Chuck -

I'm not aware of any provision for FSK with the TR-7. The C-Line was the last to provide that
function. It could probably be done, you want to switch the Carrier Oscillator 170 Hz with a DC
control voltage, but I would feel much better about an external AFSK generator. The IF switching
for the TR-7 has provisions for the 2125 / 2295 standard tones, and I believe the 2125/2975 tones
for 850 shift, but I don't know of anyone still using that!

From: Don Cunningham
Topic: 11490 Message: 11494

Chuck,

Of course Garey is right about no provision for FSK. I am sure your Rigblaster can do AFSK with a sound card and the TR7 is capable of running 75W or so RTTY IF you have the accessory fan on the rig and power supply. Both will get pretty hot if you don't have the fans. The only problem is keeping the "current hams" from crying about a little drift!!! We didn't used to think anything of it, and were capable of following a guy up and down the band a bit, but not much anymore.

I ran a TR7 for lots of years of fun RTTY, but always FSK, I never tried to shift the PTO on it like we did the 4 lines.

Don,

I understand about the numbers, age.

I will have to check the Rig Blaster for AFSK capabilities with the TR7 and maybe a frequency stabilizer board.

One more thing. I took the main tuning knob off the TR7 and tuned the brass 1/4 inch shaft with my fingers.
I could feel bearings pinching (micro bumps) when rotating the shaft. Sometimes it felt like the shaft would hit something (Like hitting a stop) and then move on. It was a quick but noticeable resistance to turning the dial. Almost as soon as I felt this quick resistance, in rotating the PTO shaft, it would release and begin to rotate normally, hat is, rotate with micro bump feeling of the bearings.

Any way, I guess AFSK is it?

Old TUs for use with mechanical teleprinters used the 850 Hz shift. In those day AFSK was used on VHF/UHF.

In that case the tone were 2125/2975. The current RTTY software can handle this shift.

I have a recent 2M FM transceiver that is setup for these tones for Packet.

Subject: Re: [DrakeRadio] TR7 FSK RTTY

Don,

I understand about the numbers, age.

I will have to check the Rig Blaster for AFSK capabilities with the TR7 and maybe a frequency stabilizer board.

One more thing. I took the main tuning knob off the TR7 and tuned the brass 1/4 inch shaft with my fingers.
I could feel bearings pinching (micro bumps) when rotating the shaft. Sometimes it felt like the shaft would hit something (Like hitting a stop) and then move on. It was a quick but noticeable resistance to turning the dial. Almost as soon as I felt this quick resistance, in rotating the PTO shaft, it would release and begin to rotate normally, hat is, rotate with micro bump feeling of the bearings.

Any way, I guess AFSK is it?

Chuck

Old TUs for use with mechanical teleprinters used the 850 Hz shift. In those day AFSK was used on VHF/UHF.

In that case the tone were 2125/2975. The current RTTY software can handle this shift.

I have a recent 2M FM transceiver that is setup for these tones for Packet.

Chuck,

It is all 170 cycle shift on HF RTTY now. Many of the older rigs couldn't pass 2975 through the SSB filters, so those hams went to "low tones" if they stayed 850 cycle, most just went to 170 cycle shift and it became the norm. You can't tell the difference listening or tuning them in UNLESS you try to meet on a certain frequency and each dial will read different with the low and high tones. I am old fashioned and still use dedicated HAL Communications terminal units. I am also a curmudgeon that likes to ragchew on RTTY, no "Hi/Bye" QSO's or buffer downloaders. I want to get to know folks, not just work "X" numbers each day. To each his own.

The problem you describe on the tuning shaft would lead me to believe that you have hardening grease in the bearings binding up. WB4HFN's site shows how to rebuild the PTO and may give you some clues in the pictures.
73, and enjoy the TR7,
Don, WB5HAK

Back in the DARK AGES (60's &70's) we had RTTY most evenings on 2M AM (no repeater) in Silicon Valley. We only had a small group but we had a good time.

I had a Model 15 at that time.

Same here, Bob, but we actually used old police radios converted to 2m FM on a fixed frequency (146.70) and had five or six in our group, spread out over the Southern part of Oklahoma. Loads of fun, and as you said, we met daily. Passed a LOT of RTTY art with the machines, then just rag chewed. Carried that on into the 80's with computers and screens, but of course the RTTY art was history.

I still meet a small group of old timers on 20M several days a week. Getting fewer and further between meeting new ones but there are a few.

11505. Ac-4R install help

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-24 18:00:33 UTC
From: Ernie Gray
Topic: 11505 Message: 11505

Greetings,

I am finishing up installing the mod to my AC-4 with Bryce's kit and I am at the part that has me soldering a black with from PCB "earth" to ground terminal on the 3 lug original strip.

There is an unsoldered small black wire already at that location, and no mention of it in the docs.

I ASSUME I solder both wires to ground, but I want to be sure. And I know there is a wealth of knowledge on this site. The AC-4 is for a pristine TR-4C I hole to have cooking today.

Carl -

Only the TR-3 had NO cover, just a black square. The TR-4 had a one-piece, black box with a top.
Late TR-4s had an alodine (silver/gold) cover with a removable top held by two screws. ALL TR-4Cs
had the alodine box with removabletop.

Likewise, the T-4X had the black, one-piece box with top. The T-4XB and C had the alodine cover
with removable top.

The T-4 had black one-piece, the T-4B had alodine with removable top.

Topic: 11512 Message: 11512

Hello to the group,

Maybe this will help someone else.

I have an MFJ 1275 T (4 pin mic connector) that I purchased to use with my Drake TR5 on PSK 31.

Should you purchase one be prepared to rewire the MFJ box (internal) both the cable to your tncvr as well as your mic input connector on the box.

The instruction sheet that MFJ has for the unit .....SHOULD BUT DOES NOT .....say that the units mic connector and output cable will be wired for something. In my case a Kenwood 4 pin mic.. Reference pg 5 of their instructions they show that particular unit.

Its only logical I guess, they have to wire for something. I have called them and it would be real nice if the tech (" Drake; Can't help") would tell you that perhaps they don't know, but.....all the instructions talk about are the internal jumpers.

BTW it works fine. Carl wd8nhk

Unfortunately this is very much the case now, it applies across the board to a lot of amateur radio kit and to vintage valve receivers and equipment.
You only have to do a search for FT101, FRG7, FR101 in Yaesu to see the value put on individual parts of these grand old receivers/transceivers.
The Drake are good solid equipment, I own a R4-c which performs very well but is worh more parted out. Sad but as times get hard, it is increasingly the way to get a few ? or $ in the back pocket.
I have in the past bought non working equipment for just the few parts I required and parted out and sold on the rest. Always came out in profit!
But I would not part out my Drake!

Oh, I was just being a smart alek. My humor tends to run on the sarcastic side.
I should know that was what you were looking to do, as I've seen plenty of your posts. I just HAD to ask though. My sarcastic side was just screaming at me, to inject a little levity.
I really didn't mean to be a pest, my bad humor is not always well received.

Dan

Hope you find one. I just had a nice L-4B plus MN-2000 follow me home from HRO San Diego last weekend and am totally thrilled with them. Looks good next to the "B-Line" too!

Anyone looking for an AL-811H or LDG-1000ProII Autotuner? My antennas are resonant designs so I don't know why I bought that tuner, as nice as it is.

73,

Roger, K6EQ

Joe,
All joking aside. November of 2010, I bought one, at a swap meet. The fellow selling it was selling for another ham, who had to move into a assisted care facility, due to advanced Alzheimer's. It was in near mint condition, physically, externally, and they were asking $750. The chassis was bright, and not corroded, at all.
Due to the circumstances, I wanted to pay full price, because of where the money was going. But, I only had $704 on my person. The sellers were packing up to leave, and didn't want to wait, for me to sell a couple of more items, so they took the $704. I got home and checked it out, and all was good. No issues, whatsoever. I thought at that time that $750 was a very fair price, for one in such nice shape. I would think that with the devaluation of the dollar, to a buyer who can afford it, one with no issues, in good physical shape ought to fetch between $800-$900, maybe a bit more.
Oh, and did I mention, that mine came with 2 spare NOS Eimac 3-500Z's, in unopened boxes? I actually felt bad, for getting it so cheap. But, the fellows who were selling it, didn't think the extra hour, it might take me to sell more stuff, was worth the wait, for $46, more. They had to get on the road back to the central coast of California.
The only negative on the amp, was the owner's call sign, was engraved on the bottom of the power supply, and on the inner chassis, on the RF deck. But, luckily, done professionally, not a hack job. He obviously took good care of it.
I can't wait to complete my move, and get it set up in my new shack, with my B and C Twins.

One just sold up here in IL at a hamfest for $500. Rebuilt supply, but the cabinets were painted a glossier black. I think his initial asking price was more around 750.

YMMV

Dan,

Thank you for the latest from the market place for a L4-B. the "extra" 3-500s were a valuable "toss in." That was a feal and a half!

See that, Mike? (I wish that I had an extra pair of 3-50Zs to sweeten the deal :>)

I had a chance at one at the fest in Deerfield, NH, from a friend, for $650 but I was out of dough. I did buy his B-Twins for a similarly attractive price and the transmitter is now part of my station. I couldn't believe it was in even better shape than the one I had.

Yeah - $650 was a steal and my friend knew it - he just wanted to clear out his shack so that only his contest station was there. I think he's running multi-two these days

11533. Re: [DrakeRadio] Drake TR-4 resistor

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-27 15:39:48 UTC
From: JD Reich
Topic: 10991 Message: 11533

Morning Garey,

I received the CD and it is such a great assortment of documentation and pictures, all of which have been very helpful.

Back to the TR-4 I am working on, I again tested across r140 with power off and got 11.9 ohms. With power on I get 152.5 voltage to ground at the top of r140 and 46.4 at the bottom, with the red wire.

I also am getting 46.4 volts at the PTO and Q4, so I assume those might be bad, however before replacing those, why am I not getting a current drop after r140? It seems to test within the spec of 12k, but doesn't seem to be dropping the 152.5 volts down?

thanks
JD

11534. Re: [DrakeRadio] Drake TR-4 resistor

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-27 16:12:01 UTC
From: Garey Barrell
Topic: 10991 Message: 11534

Hi JD -

I assume you mean 11.9 k ohms for R140. I'm sorry, I've got several of these projects going at the
moment and I've forgotten which s/n your TR-4 is?? Want to make sure I get the right schematic!

One end of R140 should be tied to Pin 1 or Pin 5 of V20, and should have very close to +150 VDC on
it. The other end of R140 'should' have ~11 VDC on it, and should be connected to the PTO (Wht/red
wire into PTO via hole in bottom) and to the Collector of Q4 (if present).

The reason you are seeing such a high voltage is because either the Zener diode inside the PTO has
failed open, or the 100 ohm decoupling resistor to it has openedup. I suspect a failed Zener. If
this is the case, then both semiconductors inside the PTO are likely failed and will have to be
replaced. If the problem is just that the 100 ohm resistor has opened up then perhaps the Zener
failed shorted, and the semi's areprotected. Q4, if present, may or may not be destroyed by the
overvoltage. You can just disconnect Q4, it's only job is to kill the PTO and allow the RV-4 to
control the transceiver. So get it out of the way.

You're going to have to pull the PTO. First remove the MAIN TUNING knob and dial plate. There are
three spade bolts on the gearbox that go through the chassis and have 6-32 nuts on them. There are
three or two wires going into the bottom of the PTO circuit box. They will need to be disconnected
AFTER their location has been photographed and/or drawn / marked, etc., whatever you need to get
them back in the correct places!. There will be three wires with Red, Green and Black. The Red is
+10V, the Black is ground, and the Green is PTO output. Later versions had small coax in place of
the Green lead. You'llhave to remove the light shield and dial diffusion stuff. WARNING! There are
two tiny spacers on the light shield bolts, between the front and sub panels. When you pull the
bolts out, the spacers fall and instantly disappear! Watch for them and catch before they escape....

Work slowly and carefully, and it's a piece of cake. Especially after you've done it a few dozen
times! :-)

11535. Re: [DrakeRadio] Drake TR-4 resistor

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-27 16:14:29 UTC
From: Jim Wiley
Topic: 10991 Message: 11535

Something must be amiss here. According to your statement (below), you have 106 volts across R140. (152.5 minus 46.4 equals 106.1). You also say R140 measures 11.9 ohms. If these measurements are correct, there is a problem. Using ohms law, those numbers equate to 8.91 amperes through R140. That comes to 945 watts!

May I respectfully suggest some re-checking is in order.

JD -

One more thought. Be sure that the Red Wht/red wire is actually connected inside the PTOand hasn't
come loose. Verify connections between the Collector of Q4, the PTO input, and the 'low' voltage
end of R140

Jim -

Yeah, but we miniaturized the Watt! :-)

R140 is a 12k resistor. And there's 'supposed to be' a 10V Zener on bottom end. Obviously not!

73, Garey - K4OAH
Glen Allen, VA

Seems other Drake stuff has been high lately. 3300 high (?) pass filters that usually go for about 15 have been 35 and 45 lately. Saw a beautiful C-4 console with power strip that topped 800, though it was a very nice looking unit. Tom wa9yi

11539. New Member

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-28 04:10:23 UTC
From: Richard
Topic: 2733 Message: 11539

At the urging of Garey, K4OAH, I decided to join this group. Over the years I've owned several R4s, a C-Line, four 2Bs, a 2C and 2NT, and a couple of 2M FM rigs.

I've been a ham for 50 years, first licensed in 1963 at the age of 16. After college I went into the USAF (Comm Commamd, what else?) and retired after 20 years. For 17 years I taught VoEd Electronics to incarcerated male inmates in a Pennsylvania prison. I retired in 2006 due to medical reasons and have been enjoying retirement ever since.

I have written a total of seven books, the last four for the ARRL (all four editions of "The ARRL's Low Power Communications, the Art and Science of QRP"). My by line has appeared in feature articles in Monitoring Times, National Communications, CQ, CQ-VHF, Popular Communications and QST. From Jan 2000 to Dec 2003 I was the QRP editor for QST. I recently retired from "The Learning Curve" column in CQ Magazine.

Having cut my teeth on vacuum tube gear I am finding that I am returning to my roots. My current Boatanchor project is a 2B restoration. This is the 4th 2B I've owned, so I think I'll keep this one!!!

This group seems like a good place to share info and learn things, which is why I joined.

Hope to see some of you on the air.

This message was originally HTML formatted. View in a HTML capable client to see the original version.\r\n\r\n Welcome to the Group, Rich. As a fellow " first licensed in 1963 at the age of 16" ham, I too think fondly of my first rig (well, pretty fondly for the Eico 720 I built, not quite so much the NC-190 receiver which drifted faster than I could turn the dial). Anyway, Ron Baker (wb4hfn@...) just restored my Drake 2B and 2BQ - they look like they just arrived via time-warp from Miamisburg. I would touch base with him about your needs. He is a great guy who has worked on my C-lne as well, and many on the internet here know him well, and the results of his efforts. His on-line website is one of the ones that nicely lists resources for Drake parts and such. I have learned a lot from my interaction with him.

I agree! Without unobtainable parts being available, many of my projects would have just faded away. I would prefer to fix rather than part out - I'm glad that there are a few individuals doing this.

The parts made available are long out of production - only place to get replacements is another radio - works the same as cars.. Can't save 'em all!

Because of all of the parts available, I've been able to restore more radios.. All of my TR-7's have updated boards in them. Someone will end up with some good radios someday. We are just caretakers of some of this gear, hopefully it will go on, outlasting me.

Besides that, I don't have the room to store parts radios obtained to fix others - much better to just get what I need - sharing the wealth!

What is involved in making reproduction parts? For example: Is is practical to have knobs made?

Someone on eBay just spent $53.59 for a 2-A/B/C main tuning knob without the dial skirt and someone else $28.59 for a 2-A/B/C preselector style knob.

I would like to have two preselector style knobs, but am not willing to pay over $50 for them.

Could reproductions be made cost effectively in small quantities? How many of us would buy knobs? 50? 100?

As a former boss of mine liked to say "Being unencumbered by knowledge..." I know nothing about what it would take to make reproduction knobs, but am curious. Anyone with experience in this type of thing have comments?

To reproduce perfect copies one would need the original molds.

If not then those molds would need to be made. Figure about 4 grand each for a plastic injection molding machine. Two molds are normally required.

Perhaps off shore? It would be possible and more than likely cheaper.

But you would still end up with mold cost, set up charges, shipping, and the cost of the part plus a few bucks profit.

Then there is basic demand. How many could you possibly sell? What's the market? Would you pay $80-$100 for a knob for a radio?

I've been thinking of coming out with a metal cover for the ac4. A few more vent holes and a powered fan for extra cooling.

The people that make my cabinets quoted me $18 for the top. Add in a Dx fan, hardware, finger guard, and some $$ to cover my cost and I guess the cover with a fan would need to go out the door at about $30.

Is there a market that will spend that amount of money for a hunk of metal an a small fan?

I don't believe there is.

I looked into making replacement dials for the rigs. Until reality slapped me across the face. That's why no one is making them.

Darrell,
I can't speak to the feasibility of making reproductions, but I do know that often times you will be able to find what you need from Mark, at www.ke9pq.com/, Nationwide Radio & Eq. Sales in Milwaukee, WI, or from Gary WZ1M at Transformer Rewinding Service, in Orono, ME. Gary's webpage is www.tubes_tubes_tubes.tripod.com/
Both, sell good quality, good condition used parts for old boatanchors, and are honest, reputable dealers, of the products they sell. I have always been treated fairly, paid fair market value, and got fast service, from BOTH of them. I recommend them highly.

Even real junkers can have a wealth of good parts in them.

I do keep one T-4XB in a closet for parts: it had been butchered pretty badly and would take weeks to set right (Pete Juliano knows - he got one from the same guy and spent weeks on it). I've scrounged a cover, ball drive and PTO from mine so far to make complete, working rigs. I do sometimes get tempted to sell off the rest of the parts of this one, so ask if you need a B-Line part as I may have one available.

Krusty the Transmitter is one story of a resurrected rig. I wish I had saved the pics the seller put up on eBay, as I didn't do any "before" photography. This rig looked like it would never work again and was missing a top cover. A lot of cleaning and tweaking later, plus a spare cover and it's back on the air!

BTW, you can see Krusty on eBay right now, if you wanna see how he came out:

http://www.ebay.com/itm/140910638943?ssPageName=STRK:MESELX:IT&_trksid=p3984.m1555.l2649

Not really a solicitation, as I had offered to sell previously - just easier to give y'all easier access to all the pics!

I agree! Without unobtainable parts being available, many of my projects
would have just faded away. I would prefer to fix rather than part out -
I'm glad that there are a few individuals doing this.

The parts made available are long out of production - only place to get
replacements is another radio - works the same as cars.. Can't save 'em all!

Because of all of the parts available, I've been able to restore more
radios.. All of my TR-7's have updated boards in them. Someone will end up
with some good radios someday. We are just caretakers of some of this gear,
hopefully it will go on, outlasting me.

Besides that, I don't have the room to store parts radios obtained to fix
others - much better to just get what I need - sharing the wealth!

It all depends, but would mostly hinge upon finding a hobbyist who could make them for you for fun. Any of these parts can be reproduced; a lot of the knobs for the 4-Line are available as new parts still.

What is involved in making reproduction parts? For example: Is is practical to have knobs made?

Someone on eBay just spent $53.59 for a 2-A/B/C main tuning knob without the dial skirt and someone else $28.59 for a 2-A/B/C preselector style knob.

I would like to have two preselector style knobs, but am not willing to pay over $50 for them.

Could reproductions be made cost effectively in small quantities? How many of us would buy knobs? 50? 100?

As a former boss of mine liked to say "Being unencumbered by knowledge..." I know nothing about what it would take to make reproduction knobs, but am curious. Anyone with experience in this type of thing have comments?

11562. RE: [DrakeRadio] Drake 2B Restoration

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-28 23:59:09 UTC
From: Rich Arland
Topic: 11540 Message: 11562

Tnx for the info, Hank. I, too, had an Eico 720 about 20 yrs ago. Rebuilt it and used it for a while. Cute little TX.

I will definitely get in touch with Ron. I don't have a lot of $$ in this receiver so I can spend some cash without feeling too guilty. If a re-screened front panel is over $100, I will probably just wait for a good looking 2B to come up on line and scoop it up and use the one I have for spares.

Thanks again.

This message was originally HTML formatted. View in a HTML capable client to see the original version.\r\n\r\n Welcome to the Group, Rich. As a fellow " first licensed in 1963 at the age of 16" ham, I too think fondly of my first rig (well, pretty fondly for the Eico 720 I built, not quite so much the NC-190 receiver which drifted faster than I could turn the dial). Anyway, Ron Baker (wb4hfn@...) just restored my Drake 2B and 2BQ - they look like they just arrived via time-warp from Miamisburg. I would touch base with him about your needs. He is a great guy who has worked on my C-lne as well, and many on the internet here know him well, and the results of his efforts. His on-line website is one of the ones that nicely lists resources for Drake parts and such. I have learned a lot from my interaction with him.

K9STH makes some repro Heath knobs with some sort of resin casting process. So,
it can be done.

Yep, it's a growing use case. The Tek group has a fellow making all sorts of un-obtanium decorative parts to restore older units. One could print knobs, trim parts, even interior parts like lamp mounts.

'Course, $500 is a lot to spend to make a 2-B tuning knob...

rich,

yeah, if I don't die between now and then.

won't be at the fdim, unless I pop in, a friend has a room about a mile from the fest and it's a lot quicker to get and come back from other than fairlawn or whatever it's called.

11570. Re: [DrakeRadio] Drake 2-B Restoration

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-29 21:03:38 UTC
From: Garey Barrell
Topic: 2733 Message: 11570

Rich -

Seems as if your reputation has preceded you here! :-)

You might want to check with Tom at Hayseedhamfest.com about a front panel 'overlay' for the 2-B.
He doesn't have one for the 2-B yet, but could be convinced! He's pretty busy making electrolytics,
but I think his Son actuallydoes the panels. They're about 6 mils thick, and just stick on and then
cut out openings with an X-Acto knife. I was concerned about the slide switch openings, but after
seeing a hi-res photo I don't think it'd be a problem. Probably about $35.

73, Garey - K4OAH
Glen Allen, VA

Drake 2-B, 2-C/2-NT, 4-A, 4-B, C-Line
and TR-4/C Service Supplement CDs

11571. L-4B (and others) Switch assembly

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-29 23:15:05 UTC
From: Mark Pilant
Topic: 11571 Message: 11571

I just purchased a couple of replacement switch assemblies from KE9PQ; for when the ones I have give out. It appears he still has a few left, so if you are looking to fix the switch on your amp, this may be an option.

I have no interest, financial or otherwise. I'm just trying to keep my Drakes alive :-)

11572. Re: Cinch Jones Connectors

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-29 23:49:58 UTC
From: k5fex
Topic: 11548 Message: 11572

Turns out changing pins is quite simple!

on the solder side of the connector, the soldering area has been twisted about 40 degrees. Simply use needle nose pliers to twist the end of the pin to align with the opening in the connector. The pin will now slide out of the connector. Reverse the procedure to install the new pin.

--- In DrakeRadio@yahoogroups.com, "k5fex" wrote:
>
> Anyone ever tried change out a single pin on the power connector on a T4-XC? Have one pin of the 12 that is damaged. Don't want to change the entire connector. Lots of caps and wires!
>

11573. Re: [DrakeRadio] L-4B (and others) Switch assembly

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-30 00:06:57 UTC
From: Abqcooks@...
Topic: 11571 Message: 11573

I just received a switch assembly set from him and it looks like it will
work just fine if ever needed. Thumbs up on that product.

Long as I'm taking up time and space I wonder if anyone has comments on the
shelf life of the old Eimac 3-500Z tubes. I have a set that has been idle in an
old Swan Mark II linear for a long time. Hasn't been powered up for 18 years
due to a fried B+ xfmr in the external Swan power supply deck.
Not that I need to try and use the tubes yet ..... I had long ago decided to just
keep them as spares for a while. Funny how 'a while' turns into 18 years so quickly !
I now wonder if they are really spares or more likely to be a gas arc power supply hazard
if tried
in a working amp ? Just food for a topic. 73 Jim

Subject: [DrakeRadio] L-4B (and others) Switch assembly

I just purchased a couple of replacement switch assemblies from
E9PQ; for when the ones I have give out. It appears he still
as a few left, so if you are looking to fix the switch on your
mp, this may be an option.
I have no interest, financial or otherwise. I'm just trying to
eep my Drakes alive :-)

Rich -

Seems as if your reputation has preceded you here! :-)

You might want to check with Tom at Hayseedhamfest.com about a front panel 'overlay' for the 2-B.

He doesn't have one for the 2-B yet, but could be convinced! He's pretty busy making electrolytics,

but I think his Son actuallydoes the panels. They're about 6 mils thick, and just stick on and then

cut out openings with an X-Acto knife. I was concerned about the slide switch openings, but after

seeing a hi-res photo I don't think it'd be a problem. Probably about $35.

11575. TR 5 ALC

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-30 03:59:39 UTC
From: Woody
Topic: 11575 Message: 11575

Hello, while we're waiting for the storms to arrive tonight late, I'm fooling with my TR5 ALC trying to get the power down to run a Transistor Amp that takes about 22 watts drive (no its not a CB amp) to get 500 out. A friend built me a circuit up to put out up to 12 V neg. I've adjusted it up and down the power will go down to about 50-60 watts out and then just drops out. I can't figure it out, which isn't saying much.
Any help would be appreciated!!!
Thanks

11576. MN-2000 Tuner Swiped in USPS Transit

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-30 05:31:31 UTC
From: mike_ai6ii
Topic: 11576 Message: 11576

I had a strange Drake related experience. I bought a MN-2000 Tuner in very good condition from a ham via qrz.com. He packaged it carefully and sent it USPS. At a weight of 16 pounds the postage was $50. It was around the holidays and took four extra days to arrive having been held up in transit from NJ to Richmond, CA. When the package finally arrived it looked like it had been opened and not very carefully resealed. It felt way too light when I picked it up. The reason? ...it was empty except for the packing material which was all still in the box. But the tuner was gone. How does that happen? The postage stamp was there so it got into the USPS system and it was delivered (and tracked the whole way.) So someone had to have taken the tuner out somewhere in the transit cycle and sent the box on for final delivery (to cover his/her tacks?)

Weird! It was insured so I did not lose any money, but who would have thought such a specialized piece of equipment would be so slyly ripped off? A ham thief in the USPS? Really?

Had similar with a delivery from the US to Australia.

Item was several sets of low band vhf cavities, the cost of shipping was greater than the items.

I refused delivery as weight was 500kg short.

Yes, we thought, probably stolen for the metal content.

Turned out that sender "forgot" to pack the units. Shipper showed "in" weight as effectively empty.

Now hold on a second, Arland, tis me you're talking to.

If I remember it was three, perhaps five years ago when you cornered me in the hallway at FDIM.

You stood there, rocking on the balls of your feet, telling me with a big grin on your face and looking like a old curious barn cat how you just managed a QSO with a JA7 using the seventieth odd harmonic of a tv color burst crystal. Two diodes, three resistors, a rusty razor blade and a paper clip. You powered the whole shebang using the static build up from two pencil erasers and a furry cat.

I said, "And you expect me to believe that you got a 599 from from that JA7 using just that?"

"Oh hell no," you replied, "His meter was to stingy□I only got a 589."

That's the rich I know...

Woody "KO4BG"
Woody, Just as a question have you just fed to a dummy load and tried
adjusting the ALC.? My TR5 comes down to 10 W (or less) for PSK31.
I will mention that key down vs ALC when in a cw mode will give you two
different wattage outputs.

11582. FL-500 insertion loss ?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-30 15:45:30 UTC
From: Michele
Topic: 11582 Message: 11582

Hello group,
I recently purchased an old FL-500 filter for my R4C. I noted that the insertion loss is quite high, with respect to the standard SSB filter. I tried by monitoring the level of the signal injected by the calibrator, and it goes down quite a bit when I insert the 500 Hz filter; the loss is much lower when I insert the 1.5 kHz filter.
(Yes, I centered the PBT for the maximum signal).
What is your experience on this? Do I have a (too) aged filter ?
73,

Michele IZ2EAS

Michele -

What is the serial number of your R-4C?? Later units had a 'T-7C' transformer that increased the
gain when 500 Hz was selected to compensate for the greater insertion loss of the narrower filter.

On my R-4C there is no significant loss going from the SSB filter to 1.5 KHz, a half S-unit loss at 500 Hz and one S unit with the 250 Hz filter.

Try using DeOxit D100L on the mode/filter switch,and try putting the 500Hz filter in another filter socket on the back panel. Just now I had to jiggle the switch to get a good signal with my 250Hz filter so it's time for DeOxit again.

I haven't looked at the photos but there are a couple of aftermarket kits to convert various wattmeters from average reading to peak. I recall that at least one of those was for the Drake W-4 and even had a mounting bracket.

Many peak reading wattmeters use a sample and hold circuit to remember the highest level of rectified RF. This stored dc voltage must be removed to for the next measurement so there is an RC circuit to discharge the stored sample. I suspect the HANG pot controls the discharge rate.

CAL might be an adjustment for the peak reading. Fed with a constant signal amplitude, peak and average should be the same.

My guesses.

OK. Your receiver almost certainly has a T7, without the tap. Other than a minor inconvenience of
having the S-Meter read low, it has no 'real' effect on the performance of the receiver. There is
more than enough IF gaintomake up for the additional loss in the two lowest bandwidth filters.

Certainly not worth the effort to replace the T7 and associated cables.

Well, the Misc file is where I looked but I went through it again. There are two folders for T10 and T11, one is a schematic, the other is a photo. Nothing that talks of T7-C Update.
73,
Don, WB5HAK

Garey,

I have Ver-1.02 of your CD and my T4XC/R4C is in the SN#29XXX series. I cannot find the modification on my CD also. I looked all thru the Misc folder. Cam I get a copy of the Modification?

11597. TR7 PTO Tuning Knob

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-31 03:10:38 UTC
From: aa5wg
Topic: 11597 Message: 11597

Hi to all,

I took the main PTO knob off my TR7 and replaced it with a nicer knob.

Yep, the nicer knob did not work completely. The analog portion of the dial would not spin correctly. It was slipping.

My TR7 has, what it looks like, two female keyway cutouts on the threaded portion of the shaft. There is a rubber like bushing that is fitted over this threaded part of the tuning shaft.

Do all TR7/s have these two cutout keyways on the threaded bushing?

My nicer knob has no male keys to fit into these female keyways and thus I cannot spin the analog portion of the dial.

Are these two female keyways on the threaded bushing normal?

Thank you,

Chuck

11598. Drake 2B Restoration

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-31 04:58:24 UTC
From: Rich Arland
Topic: 11540 Message: 11598

First of all, thanks to the multitude to wrote me and offered help. I love this list!!

One thing that a member of this list imparted to me was the fact that some of the resistors might have changed value. I have encountered this in Hallicrafters and Hammerlund receivers....normally the shift was UPWARD from the indicated value. In several SX-71s I have restored the resistors were over three times the indicated value!

My question: Has anyone run into this on Drake gear, in particular the 2B? I intend to do a fully set of voltage checks, but just wondering about the resistor values changing.

Tnx in advance.....

>
> Tnx in advance.....

Not on a 2B because I don't have one but I certainly
have on a T4XB where the cathode resistors of the finals go
high. Some brands seem to be much less stable than others.
The resistors without mold seams seem to be the stable ones,
those with seams to rise in value. The mechanism for the
change in resistance of carbon composition resistors is
fairly well known. The amount of change depends on the mix
of materials used in their construction. I have also
encountered some very high value resistors that went _low_.
Not many and all on the order of 10 meg or so. All were in
very old Hallicrafters receivers.
Carbon comps are always worth checking if there is any
sign of voltages being off. In general small sizes change
more than large sizes and high values change more than low
values. Exposure to heat will make them change value,
usually upward. The best of the bunch were Ohmite and
Allen Bradley. These look enough alike to have come from the
same factory but I don't have anything specific about that.
Modern deposited film resistors are far more stable and,
except for some odd applications, are superior. The ones I
checked on my ancient and honorable Boonton RX meter were

essentially pure resistances up to quite high frequencies.

From: w7jpg
Topic: 11582 Message: 11600

Hi Garey,
I am a bit confused about the amount of insertion loss that is recouped by T-7C. My SN is 16188 so my set does not have the T7 tranny, correct? That means that when I switch to my 500 or 250 Hz filter, there will be an insertion loss. My rcvr is out of service at the moment so I can't run any tests to post here.
Question 1. For the early SNs, what is the observed insertion loss when switching in these filters? Question 2. How much of this loss did the T7 tranny recoup? OR: what is the observed insertion loss when switching in these filters with T7 in place? After reading the other posts in this thread, I would surmise that the answer to this question would be: "very little" or "no loss" (S-meter reduced readings not relevant). Just want to be sure I "got it right". Question 3: My service disc is version 1.02 and does not have the R-4C T7-C Update Modification.pdf. How do I get my hands on his mod? (just realized this Q was also asked by Walt, KA2NJF)
Thanks,
Chris

11603. FF-1 Crystal Specifications

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-31 02:42:47 UTC
From: Jonathan Reid
Topic: 11603 Message: 11603

I have a FF-1 Fixed Frequency Adapter for a 4-series transceiver.

It has no installed crystals. I'd appreciate advice on two questions:

1. Are the required crystal(s) offset by any amount, or is it designed to simply replace the vfo frequency. In other words if I want, for example, to use one crystal to transceive on 14.070, do I need a 14.070 crystal or some other specification. I cannot find any specifications in manuals.
2. Any recommendations on a source of ctustom crystals from someone with experience with the FF-1?

I appreciate any guidance.

Jonathan Reid, K8JER

11607. Re: [DrakeRadio] FF-1 Crystal Specifications

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-31 15:02:40 UTC
From: Garey Barrell
Topic: 11603 Message: 11607

Jonathan -

The FF-1 crystals ARE offset. The oscillator in the FF-1 merely replaces the PTO output, so the
crystal frequency for SSB will be the BAND crystal frequency - desired output frequency, e.g., there
is no 20M BAND crystal, so the crystal would be 14.070 - 9 MHz = 5.07 MHz. For 40M the BAND crystal
is 12.5 MHz - 7.070 = 5.43 MHz crystal frequency. For CW you must subtract another 1 kHz, = 5.429
MHz. EXCEPT on 80M, where you must ADD 1 kHz to the crystal frequencyfor CW.

I would recommend International Crystal Mfg. They have all information necessary to make crystals
for ANY Drake equipment. <ICMFG.com>

Barry -

I don't know why you can't upload to FILES. Send me your file and I'll put it up and check your status.

One caveat with Drake Voltage and Resistance charts. The are usually pretty close for the first
version. In more than a few cases, I have found that while the schematic was changed the V and R
charts were NOT. So take those readings with a grain of salt. If one is off, examine the schematic
andsee if the reading 'makes sense'.

There are other problems, some due to using a modern DMM rather than the 11M input impedance VTVM
(Heathkit) used by Drake. The 1M resistor at the VTVM probe tip is critical when measuring oscillator or converter grids. A DMM lead, which doesNOT have the resistor, will kill the oscillator, changing the reading considerably. Another problem with the Resistance charts, especially for those readings that go back through the power supply bus, is the polarity of the
ohmmeter. Again, the VTVM is pretty repeatable as you normally work with one lead clipped to
chassis, the ohmmeter circuits all seem to have the same polarity and voltage. So ifone of those
readings is off, try reversing the polarity of the meter leads.

Other than that, they're fine! :-) I don't use either, finding it easier to look at the schematic
to see if a voltage reading 'makes sense'. The resistance readings are rarely consistent, and you
might have three resistors in a series path. If you are concerned about resistors, you're much
better served to just go measure each one. Actually, I don't think I have ever found an out of
tolerance resistor in 2 or 4 series radios that wasn't burnedor otherwise damaged. I know some of
the manufacturers used less reliable resistors, one in particular that had a 'bumpy' surface and
another that had a clear'beltline' where the halves were glued(?) together. Drake used Allen-Bradley, which were the highest quality carbon comp resistors made.

11612. Re: [DrakeRadio] Drake 2B Restoration

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-01-31 15:35:13 UTC
From: Barry
Topic: 11540 Message: 11612

Garey,

I sent the file to you. It should be just a copy of the values from the back of the manual I have. It isn't anything very fancy. I just wanted something I could write on (or enter the values and highlight the ones that needed further examination, etc.) and print/reprint as I wanted.

Thanks,
Barry - N4BUQ

Chuck -

You're welcome, I guess! :-) I was commenting on Jim's analogy rather than the problem itself.

The back of the knob MUST be flat right down to the 1/4" hole, with a small tab extending to engage
the slot in the brass sleeve. This is accomplished by the dished kHz dial skirt on the original knob.

The drive system operates by compressing the rubber 'doughnut' to cause friction on the brass
sleeve. The tab allows the brass sleeve (which drives the dial, to be held in position while turning
the knob to 'register' the dial to '0'.

I think I am right but do stand to be corrected, these are the RCA AR88 or it certainly looks the same.
I bought a very nice AR88 in full working order (gosh they are heavy!) but the case was scruffy.
Came with a spare set of tubes and a replacement perspex meter / dial panel.
Sold it, completely untouched from the condition it was when I bought it for over twice what I paid.
It was working but will need a little attention to bring it up to spec.
A lovely old receiver if you have the space, but not at that price, far far too much.

I think I am right but do stand to be corrected, these are
the RCA AR88 or it certainly looks the same.
I bought a very nice AR88 in full working order (gosh they
are heavy!) but the case was scruffy.
Came with a spare set of tubes and a replacement perspex
meter / dial panel.
Sold it, completely untouched from the condition it was when
I bought it for over twice what I paid.
It was working but will need a little attention to bring it
up to spec.
A lovely old receiver if you have the space, but not at that
price, far far too much.

Ian

Its a CR-91, which is a later version of the AR-88. The
main difference is that a control for the crystal phasing
capacitor is brought out to the front panel. For some reason
RCA failed to do this in the AR-88 even though they did in
the earlier AR-77. This receiver was built by RCA in
Canada, perhaps for the Canadian Air Force, who used many of
them. Camden was overloaded at the time. It is NOT a double
conversion receiver as stated in the ad. I strongly suspect
the price is a mis-print.

Ian

Correction, the CR-91 is the LF version of the
AR/CR-88. The statement about the crystal phasing control is
correct, it is present on the CR-88 (normal frequency
coverage) and the CR-91, which had two LF bands in place of
the broadcast and second band of the standard receiver. The
circuits are essentially identical. The CR-91 and AR-88LF
have 735 khz IF which may have been what mislead the seller
into thinking its a double conversion receiver.

Dick,
Likely, you will get a vicious reply, telling you to mind your own business. Unfortunately, folks who overprice things, like this item, 'think' they are sitting on a gold mine, and will take no advice, regardless how helpful, it is.
There is something that seems to make them very defensive, and I don't get it. The couple of times that I overpriced things, accidentally, (because I didn't do my research, properly), I was grateful, for the advice. Too bad that more folks don't feel that way.

Dan

I think he's trying to flush out John (MO) who is reportedly sitting on a stash of old cars and radios worth far more than the piddling price he's asking.

If that sounds like a stretch, maybe the motivation for pricing it that way is to achieve notoriety by getting on the eBay news flash for having the most spendy radio ever advertised????

OTOH, since he is OK to ship International, I suspect there are a few prospective buyers in Dubai.

Wouldn't we all have a lot more to ponder if the damn thing sold for that price? Hee Hee

Not bidding,

Chris

Hi Richard,

Thank you very much for the info re the AR88, CR91 and the AR77, I have owned both a 77E, a lovely receiver and of course the 88 is regarded as a classic.The 77 was in poor condition but I eventually got it working well to near spec and sold it on whilst it still worked. The 88 was tatty case wise but the electronics were OK and untouched and original and needed a little tweak here and there but nothing more!

Fabulous receivers, the AR88 were used at Bletchley Park and they still run them today for visitors to experience what real radio is about!

Needed some space so sold the 88, infact it went so quickly that I had to pinch myself to make sure I wasn't seeing things.

Well, there are times I think it's all about notoriety. They are looking for their item to show up on Jay Leno's "eBay, did it sell?" segment.
A few years ago, some friends of mine and I, had a small contest, to see who could sell the least valuable item, for the most amount of money. I went to my local (SoCal folks will know this) In-N-Out Burger, and got one of their free window stickers. I then put it on eBay, auction style, and it sold for over $5, plus shipping, of whatever a postage stamp and envelope cost, at the time. I wasn't trying to cheat anyone, but wound up amazed that it sold to a guy, that according to his mailing address, lived less than a mile, from an In-N-Out Burger, where he could have gotten a stack of them for free.
As it turned out, my sticker sale, (was never the intent) wound up on the Leno show. So, I firmly think that this is frequently the motivation. They don't care if it sells, if they get their minute of fame. It's what I call, Jerry Springer Syndrome. Do anything, to get on TV. Regardless, how foolish one looks.

I've more or less finished restoring an AR-88F. The F is a version used in the DR-98 diversity system. Essentially the same as the AR-88D with a very few minor changes. Mine was originally U.S. Navy surplus but had a difficult life. Very dirty and the dial window was broken in were the type label goes (meter blank). I was able to get all the parts and rebuilt it. I was also lucky enough to find an original meter which I installed. I have two bad antenna stage coils which I would like to replace. Evidently someone ran a transmitter into them. I made them work but would like to replace them.
The AR-88 is an amazing receiver, very stable and very good performance. The rack mount chassis weighs 80 lbs, in the desk cabinet it comes in at an even 100 lbs. I've had girl friends who weighed less. I've learned a tremendous amount about these receivers from working on this one.

There are more in Europe, Canada, and England than here because most were supplied as part of lend-lease and for military purposes. Evidently RCA built a version as late as the mid-1950s.
I have only ever seen one AR-77. I would like to get one someday because I am curious about the design. They are very similar in some ways to the Hammarlund HQ-120-X or rather to the later HQ-129-X.
The AR-88 was designed by a different team. It was supposed to be a cost no object design and may have cost $1000 when new!

11642. Bringing a TR-4C back to life

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-02 11:02:22 UTC
From: Ernie Gray
Topic: 11642 Message: 11642

Hello Group,

I have a TR-4C s/n 37210, very very clean, aluminum chassis, no scratches on the front panel, a few minor nicks on the bottom shell and I had the top shell powder coated satin black and it came out very nice, needs a knob inlay. The TX pumps out almost 175 watts into a dummy load on 40 meters and I recall that is good. On RX, I regularly copy signals 59+ on 40. The AC-4 has the Bryce kit installed and works well. The matching MS-4 needs refinishing, another trip to the powder coaters. AND I have an MC-4 too to top it all off.

I tested all the tubes and the 12BA6's , all 3, tested weak. I bought some contact cleaner at Rack Shack and cleaned the band switch contacts with the sideband switch but it leaves an oily residue so I did not use it further, and I recleaned the switch contacts with acetone and swabs.

Wiggling the tubes in their sockets produce lots of noise so I feel I need to clean the tube sockets and pins but do not know the best way to do that. I am also curious which components typically gets changed due to age. I do not "hear" or see any issues with electrolytics and the T/R relay sounds good.

Cheers,
Ernie

Ernie -

I'd just use the finals as they are until they're done. It all depends on what sort of output you can get on 20/15/10.

A very small amount of Deoxit on the tube pins will ensure good contact, but it seems from what you describe that the receiver is working okay as is.

What are you getting for output on 10, and does max power out coincide with a dip in the plate current when tuning? I've found output can be low if neutralization isn't right (though mostly on the higher bands).

Steve,

I have not tried anything under 20 meters yet, but output is good on top 3 bands. Will tune it up on 10 meters today and see what the output is.

Like I said earlier, when I rock the tubes in their sockets, I get some noise in the receiver. Iwill get some Deoxit later and treat the sockets, and I have some fine Scotchbrite pads I thought I would clean the tube pins with. I figure jamming the tube through the Scotchbrite pad will,give the pins a good scouring. Maybe I'll try dousing the pad in acetone too.

The TX pumps out almost 175 watts into a dummy load on 40 meters and I recall that is good. On RX, I regularly copy signals 59+ on 40. The AC-4 has the Bryce kit installed and works well. The matching MS-4 needs refinishing, another trip to the powder coaters. AND I have an MC-4 too to top it all off.

I tested all the tubes and the 12BA6's , all 3, tested weak. I bought some contact cleaner at Rack Shack and cleaned the band switch contacts with the sideband switch but it leaves an oily residue so I did not use it further, and I recleaned the switch contacts with acetone and swabs.

Wiggling the tubes in their sockets produce lots of noise so I feel I need to clean the tube sockets and pins but do not know the best way to do that. I am also curious which components typically gets changed due to age. I do not "hear" or see any issues with electrolytics and the T/R relay sounds good.

Cheers,
Ernie

I forgot to report back onmy luck withthe SWITCH CAP I purchased from TR7DUDE on eBay, to repair the power switch function on the ganged pot of my T4XB

It did work, but had to slightly file the 'arm' with a small, circular file for it to clear something. It was a bit of a pain, but it made the radio 'whole' again.

Not sure if he still has them listed, but they were inexpensiveand retained the stock on/off function of the T4XB

The ebay listing has long since been removed socan't give specifics.

Ernie:

There will likely be a response from Garey here before I hit the send button.

Sounds like you have the TR4C pretty well tweaked and ready to go. Just did the tube pins to eliminate noise on one of my rigs - a TR-44C - with a small drop of De-Oxit on a brush, wipe each tube pin, one tube at a time, and re-install in the socket a couple of times. That's all that was needed on mine, May have repeated a couple of times on the odd tube to eliminate the "wiggle noise". Works very well. I would not use any abrasive on the tube pins.

Pretty sure the PA setup is the same as the T4X transmitter, just one more tube - I would check the screen dropping resistors and the cathode resistors on the PA tubes to make sure they haven't drifted high as they often do. Each group should be very close in value as well. Doing this from memory at the ski hill as I have my morning coffee and watch the sun come up, so dangerous at my age I know, but think the replacement screen resistors should be 68 ohm 1 watt and the cathode resistors are 15 ohm 2 watt. Search the archives for lots of info on their replacement – "Ohmite OX and OY resistor" search should turn up the right archive e-mails. Watch replacement on the screen resistors as one end is typically tied to easily broken feedthrough caps that essentially are unobtanium.

I'd also check that pesky RCVR/TRCV switch on the back side corner – wiggle it back and forth a fire a little shot of De-Oxit in there too. Though sounds like you're getting the rx path OK.

As Steve said, check the PA neutralization when you get 10m tuned up, also well documented in the archives, and if that's OK, time to put it on the air.

Curious where you are getting your cabinets done? I'd heard the place in Miamisburg, OH that used to do the Drakes weren't doing them anymore.

Steve,

I have not tried anything under 20 meters yet, but output is good on top 3 bands. Will tune it up on 10 meters today and see what the output is.

Like I said earlier, when I rock the tubes in their sockets, I get some noise in the receiver. Iwill get some Deoxit later and treat the sockets, and I have some fine

Scotchbrite pads I thought I would clean the tube pins with. I figure jamming the tube through the Scotchbrite pad will,give the pins a good scouring. Maybe I'll try dousing the pad in acetone too.

Ernie -

I'd just use the finals as they are until they're done. It all depends on what sort of output you can get on 20/15/10.

A very small amount of Deoxit on the tube pins will ensure good contact, but it seems from what you describe that the receiver is working okay as is.

What are you getting for output on 10, and does max power out coincide with a dip in the plate current when tuning? I've found output can be low if neutralization isn't right (though mostly on the higher bands).

Hello Group,

I have a TR-4C s/n 37210, very very clean, aluminum chassis, no scratches on the front panel, a few minor nicks on the bottom shell and I had the top shell powder coated satin black and it came out very nice, needs a knob inlay. The TX pumps out almost 175 watts into a dummy load on 40 meters and I recall that is good. On RX, I regularly copy signals 59+ on 40. The AC-4 has the Bryce kit installed and works well. The matching MS-4 needs refinishing, another trip to the powder coaters. AND I have an MC-4 too to top it all off.

Hi Kevin:

Thanks for the input on the switch issue. I noticed that TR7DUDE had AC Switch Caps for R4B but wonder if it is compatible with T4XB switch mating to the mid section gain switch. I took the original switch apart and found the problem, which unfortunately, is not reparable. Maybe the R4B AC cap is worth a shot. 73's

Clean the tube pins with a small wire brush and some
Deoxit. The socket can be cleaned with Deoxit and the small
triangular brushes sold for cleaning between your teeth.

"I need to clean the tube sockets and pins but do not know the best way to do that."

Many of us use a dental proxy brush (they are available in quite a few sizes) juiced up with a bit of De Oxit 5%. Insert into each pin socket..scrubba scrubba...flush (optional) with a bit of DeOxit Gold contact cleaner. Others will apply De Oxit to the pins of the tube...insert..remove..repeat....

Either way seems to do the trick.

Good luck,
Chris

Terry,
I have had quite a bit of good fortune, and got great service, from Gary, WZ1M, at Transformer Rewinding Service. He stocks lots of parts for many old tube type radios. You can check his page here: http://tubes_tubes_tubes.tripod.com/
or you can email him, and I believe his email address link, is on that page.
He does not check email multiple times a day, or even daily, for that matter, so it might take him a couple of days to get back with you. But his prices are fair, and the parts are always good quality.
Also, check with Mark Olsen, at Nationwide Radio and Eq. Sales. He frequently has some used parts salvaged from irreparable radios, and Mark is a great guy to deal with.www.ke9pq.com
Best of luck to you, in your endeavor.

Heil makes an adapter from your headset to the Drake 3 pin 3/16" plug. BUT the Heil microphones are mostly low impedance, and the Drake 4 line requires high impedance. Heil used to sell a transformer to make their microphones fit the vintage gear, but I think it was already in the Heil "vintage" Goldline microphone, so am not sure it is still available separately.

Anyway, you need to know if your headset requires a voltage to run. An email to Heil's crew will let you know if they make something ready made to work with your headset. They also used to have wiring information on their site if you want to try it on your own, but I haven't accessed that in a long time. Low impedance won't hurt your Drake 4 line gear, you just won't be able to get enough drive out of it. The TR7 4 pin can be re-wired for low impedance. Info for that is on www.WB4HFN.com I think.

Wayne,

I totally misunderstood what you were needing. From the TR7 manual, the standard microphone connection is: Pin 1 is audio from the mic element, Pin 2 is PTT and pin 3 is the shield (ground for PTT). From the T4XC manual (3/16" plug) Tip is PTT, Ring is audio from the mic element and Sleeve is the shield (ground for PTT).

The impedance match is important, but try it, all it will do if it's low impedance is there won't be enough drive, then you can get the matching transformer. No harm will come, hi.

Hope that helps.

I do understand!

After some research, appears the proset is a 600 ohm impedance. HRO has a transformer to match to the HiZ on Drakes.

Also found the pin outs for the connectors .

Having issues with my T-4XC audio drive (even when using the D-104). Enough that I actually purchased a second T-4XC off ebay.

The new one has some issues. Freq is off by about 25KHz. What I can't figure out so far is the output. With GAIN at 9-10 o'clock, the Plate Current can go to .300 mA when tuned up on freq. At full Tune, can hit 200 watts out on 80 meters on key down. My original TX cant reach that level.

I've found it's a better idea to use denatured alcohol to clean any contacts or pins. No residue left and if you get thirsty; well, there ya go.

Seriously, if you use anything more abrasive than a piece of bond paper, it can leave scratches and microscopic grooves in the surface that promotes corrosion coming back at a faster rate. It builds up in the grooves. I've not used Deoxit but sounds like a good product.

Hello to all,

I am K7TP, Grover, in the North of California. I have had a few Drake stations over the years but now have only a 2-C receiver.

Since I spend much of my time on the air with a Globe xtal controlled transmitter and a Hallicrafters SX-28, I thought to graduate to a station with a 2NT and the 2-C receiver.

So what are my chances of finding a working, not mint, 2NT for a price under $200?

Hi Grover -

Welcome to the group.! 2-NTs show up fairly often on eBay, typically for under $200 in decent
shape. One went just recently for $330, but it was essentially new with excellent copper and final
revisions. I have seen a couple on eHam as well.

There were several changes made with s/n 1000 for the 2-NT, and another group of late changes for
the 2-C and 2-NT. The latter changes were never updated on Drake documents, but updated schematics
are on my Service Supplement CD for both units, as well as all previous versions.

A 'want to buy' on the list often turns up something.

From: Steve Wedge
Topic: 11666 Message: 11668

I've seen 2NT's at hamfests in the $50 range, so if you're patient, deals can be had.

I even bought a 2C at a hamfest (2009) for $65 and yes, it was working! Typical prices for 2C's these days approach R-4A prices due to their rarity.

Subject: Re: [DrakeRadio] Intro and 2NT

Hi Grover -

Welcome to the group.! 2-NTs show up fairly often on eBay, typically for under $200 in decent
shape. One went just recently for $330, but it was essentially new with excellent copper and final
revisions. I have seen a couple on eHam as well.

There were several changes made with s/n 1000 for the 2-NT, and another group of late changes for
the 2-C and 2-NT. The latter changes were never updated on Drake documents, but updated schematics
are on my Service Supplement CD for both units, as well as all previous versions.

A 'want to buy' on the list often turns up something.

Hi Guys,

Sure does look like someone from 'Over 'Ome has dismantled an R-4C, & is in the process of parting it out, on eBay (look at the bottom after searching "Drake R-4C", under "International Sellers").

One can only hope that this "victim" was NOT alive & well at the time of its falling victim to such cannibalism!

Anyway, a good opportunity to stock-up on what might otherwise be "unobtainium" parts & assemblies...

Hi Eddy and all list members.

This guy is "parts dx" and basically they buy up working or non-working models of certain vintage radios including Yaesu FT101 etc, Kenwoods and the classics like the Drake. Infact anything they can get hold of that is "too far gone" to be economical to bring back to a decent piece of kit.
Quite often the radios will be working but the cases are too far gone or the PA stage has suffered a meltdown.
He trades out of London and is a good source of rare parts.
I have bought from him- a power supply panel for a FR101 and he is genuine. Infact I still have the panel I bought unused as I had a brain wave and found a way round the failed voltage regulator which seemed to be a common issue.
Our Radio Club, the Wythall Radio Club who are very active in the B'ham area in the UK hold an annual rally (hamvention) and last year another guy who does the same - hifissb- was interested in two FRG7's I had for sale. I knew it was him and they would be parted out so I would not sell them to him to his annoyance but there will be occasions where good working equipment is parted out to keep the spares flowing. Sadly the many parts will make much more than a complete receiver but personally I cannot part our working kit if I can give it a good home.
I personally have a R4C- an early model which I use regularly and it's great!

11672. 1960-to-1966 Radio Handbook needed

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-04 00:25:16 UTC
From: Rich Arland
Topic: 11672 Message: 11672

Let's see how good this group really is:

I have a 1951 edition of The Radio Handbook, by Editors and Engineers. It is in tatters. Totally falling apart. I had two other editions, both from the 1960s but they have disappeared apparently during the move from PA to GA.

Anyone out there have a more current copy of this book, say somewhere between 1960 and 1966, that they would be willing to part with? If so, please contact me off-list and we'll see if we can't do a deal.

Many thanks.

Topic: 11540 Message: 11673

WOW!! What a week!!!

I ordered Garey's 2B DVD...it arrived in just 3 days! What a goldmine of excellent info on this old warhorse!

Then, on the same day, the four section cap for the 2B PSU arrived from Hayseed Hamfest. Tommy does some great work! It's almost too pretty to put into the radio!

Add to this the dial strings, capacitor replacement package, dial "noogie" (you know that little red thingie that you push/pull to cal the dial) and the rubber feet for my old Vibroplex single lever paddle arrived from 2B Radio Parts LLC!

It was like Christmas all over again! Looks like I'll have to get busy and start soldering! Thanks to all who provided information, tips, and parts information for this restoration.

One possibility is to search Amazon. I've gotten a
number of fairly rare old technical books through them. You
usually get a choice of prices. There is a PDF version of
the 1959 and 1940 editions at www.tubebooks.org These are
large files but very good scans.

From: George- K4GM
Topic: 11677 Message: 11677

Recently acquired the RV4C for my TR4Cw/rit. Unfortunately, although it powers up with dial light and red neon bulb, there is no signal arriving at the TR4Cw in any of the switch positions. I don't have a 12AU7 to swap so have not yet ruled out the tube. I have Garey's CD so will measure voltages and resistance but was curious if there are any known common problems with the RV4C or the cables etc. The TR4Cw is working fine by itself. Any thoughts appreciated.

11681. Astatic 10 DA Mic on TR5

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-04 04:01:32 UTC
From: ko4bg
Topic: 11681 Message: 11681

Hello I use a 10 DA mic on a boom and 5 position sw. so I can switch it between all my Drake Rigs and also a Ten Tec Onmi 6+. The problem is the TR5 doesn't seem to like it at all. I have it wired with the two wire hook up as I only work VOX, it keys up and I can talk with it but it doesn't do a good job, it doesn't have the punch that it should have. Anyone have any suggestions?
Thanks
"Woody" KO4BG

Check Q3 (PTO supply 11VDC). The Collector should be 11V when the RV-4C is supposed to be the
controlling PTO, and the red light on the RV-4C should be ON. The Base of Q3 should be near 0in
this situation.

When the TR-4Cis controlling, the red light on the RV-4C should be OUT, the Base of Q3 should be
+0.6 VDC, and the Collector should be near 0.

Maybe Garey or Richard, or another of the far smarter than ME, guys, can explain why there would be a difference, but on my T4X-B, the 10-DA, is it's favorite microphone. I've tried Heils, D-104's (preamp and not), Shures, EV's, and even some nice looking, but obscure brands, that I have since sold. For whatever reason, a 10-DA, on a TUG-8 stand, with the amplification set low, is the best sounding mic on my B. maybe there's a difference in the transmit audio section of the two radios, or maybe there is a modification in one of our radios, making the difference. But, I am quite happy with that mic, on my Killer B.

Rich Arland spake unto us the following wisdom:

> I have a 1951 edition of The Radio Handbook, by Editors and Engineers.

> It is in tatters. Totally falling apart. I had two other editions,

> both from the 1960s but they have disappeared apparently during the

> move from PA to GA.

What a great book!

> Anyone out there have a more current copy of this book, say somewhere

> between 1960 and 1966, that they would be willing to part with? If so,

> please contact me off-list and we'll see if we can't do a deal.

You might want to check ABE Books (http://www.abebooks.com/), I have

purchased both a 16th and 17th edition there for fair prices.

I suppose it's ultimately in the "ear" of the beholder, but the R-7 detector is designed to decode in a sort of synchronous fashion and, with the SL-4000, allows you to tune one sideband or the other with the PBT while maintaining better than 3 KHz bandwidth for good fidelity audio. To my ears, it sounds noticably better than the SL-6000 did in my R-7 - probably due to the reduced noise bandwidth and the ablility to eliminate interference from the other sideband.

By contrast, an SL-4000 in a TR-7 is horrible. You really need a 6000 in the TR-7. Never had an 8000, but that might sound too wide for me.

So....how does one go about replacing the "dial noogie" (red post) on a 2-B if I get my hands on a nice new red one??
How is it fastened in?? Can it be done from the outside or does one have to get dial glass from the inside? Please advise??

WOW!! What a week!!!

I ordered Garey's 2B DVD...it arrived in just 3 days! What a goldmine of excellent info on this old warhorse!

Then, on the same day, the four section cap for the 2B PSU arrived from Hayseed Hamfest. Tommy does some great work! It's almost too pretty to put into the radio!

Add to this the dial strings, capacitor replacement package, dial "noogie" (you know that little red thingie that you push/pull to cal the dial) and the rubber feet for my old Vibroplex single lever paddle arrived from 2B Radio Parts LLC!

It was like Christmas all over again! Looks like I'll have to get busy and start soldering! Thanks to all who provided information, tips, and parts information for this restoration.

Carl, no I'm not sure of much of anything anymore, I'm just a broke down Old Vietnam Vet and half ended Guitar Picker, that loves Drakes and has a pretty good collection of them. I just know it works great on the TR7 and also all of my Tube type Drakes. And the manual says that pin 1 & 4 are hooked together. Really I'm just a Dumb Old Guy that has way more Drakes than I need!!!!

Woody
Well Woody, from an older (geez I hate to say that) Korean vet who has really forgotten more....." what was I going to say?"
And I'll just bet you are not broke down yet.

Pin 1 is audio in (and yes hooked to 4 internally). Pin 3 is mike ground. Mike when you hit ptt took pin 2 and grounded through pin 3.
As you are running VOX and you have to have the VOX switch on the box in that position TR5, I normally leave the ptt grounded (my mike) while yakking on the audio and ground lines.

If it is an operational thing on your mike and you have a particularly deep voice you might want to install a small capacitor on the audio out line.
Carl wd8nhk

PS I have what I feel is a rather nice set up of Drake gear too........

Topic: 11681 Message: 11699

Woody -

The TR-5 uses Pin 1 or Pin 4 for the 'hot' mic lead, and Pin 3 for the shield (Ground return). Pin
2 is for the PTT.

The MIC input is designed for high impedance microphones.

The Astatic 10-DA is a dynamic microphone, designed for a 40k ohm input impedance, with an output 6
dB below (1/2) of the output of a D-104. I've never owned a TR-5 but I would imagine that the MIC
input circuitry is probably similar to that of the TR-7.

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

Thanks, Garey. I checked Q3 and here is what I found:

With the TR-4C controlling the base is .63v, the collector is 25.4v,
and the emitter is zero.

With the RV-4C controlling the base is .49v, the collector is 8.3v and
the emitter is zero.

The red lights function correctly.

Time to order a new Q3 ??

11710. TR-4 Price??

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 01:29:39 UTC
From: Rich Arland
Topic: 11710 Message: 11710

I have been presesnted with a chance to pick up a TR-4 (no PSU). I hate using e-bay as a pricing guide.

So, my question to the group: What does a TR-4 go for now days?? This is an un-tried rig. Not sure it works. Decent cosmetics, however, the previous owner said that the last time he had it plugged in that the rig didn't transmit. There is a TX/RX switch on the back (if I recall) and maybe that was in the wrong position, although I don't know for sure and he doesn't remember. There is no PSU (he sold it), so no way to ck it out prior to "doing the deal".

2nd question: How much for an AC-4? I know that there is a speaker enclosure that can house the AC-4, need nomenclature and an apporximate cost.

Thanks, gang....this is one COOL group!

Do you work a lot of cw? If so the plain vanilla TR4 is not for you.
The MS-4 speaker will house the AC4 power supply. Plan on upgrading the
AC4 PSU to an AC4-R . Simple job and fun.

The speaker that also holds the PSU is the MS-4. It IS possible to build a workable PSU from something like an old Heath HP-23, plus a few parts, which can be hidden inside the MS-4, but finding a proper AC-4 is better.

11713. Re: [DrakeRadio] TR-4 Price??

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 01:59:55 UTC
From: Paul Pollock
Topic: 11710 Message: 11713

To Richard Arland K7SZ,

I bought a TR-4 used, from a friend of mine, some time ago. Maybe my story will be helpful.

In my case, I got the radio (sort of working), an MS-4 speaker (good shape) and an AC-4 power supply (humming) in the same deal (I was lucky). Cost, all told, was $500.

Firstly, I sent the radio out to Jeff Covelli (a champion Drake tech, and a true gentleman). I got it back looking and working better than new. With the shipping, the overhaul cost me about $310, Jeff pays for return shipping.

Secondly, while the radio was out being refurbished, I purchased the AC-4r repair kit from "The Heathkit Shop", and installed that myself. If it has not been done in the last few years, it's mandatory. An old power supply, for a radio of this type, needs a thorough rebuild. When I first got the package, I was getting AC-hum from the radio audio. AC-4 rebuild, killed the hum, and ran the radio as it should. Cost of the AC-4r kit was around $85, but that was several years ago.

Total cost about $900. Believe me, getting one used and in running shape is as rare as teeth on a female pan-fish. Drakes are all quite venerable, so expect to have some repairs to do.

In your terms, if I were offered your opportunity, with no knowledge of basic condition, no power supply, no speaker; I would expect the same kind of things to do that I went through. And we haven't even gotten to the point of looking at the stuff you need to use the radio. A working, but not overhauled AC-4 is going for $125-200 on EBay. A good working MS-4 speaker will cost between $75-100, or in that ballpark. In your case, I would not pay more than $150-200 for the TR-4, unless the radio was "known" good. If the radio were a TR-4cw/rit, that's different, a pile of junk is worth $300-350 (and one in good working shape is worth more).

These ideas are my own, alone. Others will have other ideas. All of them will be relevant. Since all that, I used the radio for a while, but have since put the radio aside, for one of my solid-state radios, to preserve the TR-4 for conditions I think will come in the future.

Oh, and before I forget, the switch TRANS/RECEIVE, is strictly for receiving, it is used in cases where the user want to use an outboard receiver with the TR-4.

Hope that helps you, have fun and good luck!

11714. Re: [DrakeRadio] TR-4 Price??

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 02:04:21 UTC
From: Dan Galligan
Topic: 11710 Message: 11714

Rich,
Personally, I wouldn't pay more than $300, for an unknown, TR-4, with likely issues, that doesnt include the AC-4, and would start by offering $200, less, if it is not in "presentable" condition. There are too many things that 'could' be wrong with it, that can be costly.
That being said, I would happily pay $600, for a known good one, with little or no cosmetic issues, and would expect that it should at least include an AC-4, though would not expect it to have the AR-4R kit installed, for that price.
The problem is, there are too many variables that would impact it's value, and then, you must decide what it's value is, to you. I have one, here, that I am slowly working on, for a friend, and it is not going well. I am likely to make him an offer of about $400 for it, then send it to Jeff Covelli, as I am stumped. It does have an ugly AC-4, and the Hayseed rebuild kit for the AC-4. I know it to put out full power, but the receive is negligible, and I can't seem to finger out the issue, with the receive.
Keep in mind, that you may get off with a cheap fix, if it has issues, and you come out a winner. If it costs you another $400, to fix it, you'll be happy that you got it as inexpensively as possible.
I know I likely raised more questions than answers, but that's the problem, when buying a radio, with unknown issues. Keep your up-front costs as low as possible, so you can afford to fix it right, when it needs repairs.

11715. Re: [DrakeRadio] TR-4 Price??

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 02:56:38 UTC
From: Kris Merschrod
Topic: 11710 Message: 11715

Rich, it is a pig in a poke. So go easy. One sobering through is that if you need to re-tube it that will be about $200. Yes, tunes are not inexpensive.

"Will not transmit" could be simple, could be complex. If it is a plain old TR-4 - fine to shoot the breeze with - CW can be done and was all the time, but there are better TR-4 models.

I would err on the conservative side - perhaps $100-150. I am not a tight wad, but a lot could go into it. If you could bring an AC-4 along to test it - at least for reception, that would help out.

Good luck and keep us posted. A friend bought one at a certain exit on the Jersey Turnpike, and he had a great story to tell!

I have been presesnted with a chance to pick up a TR-4 (no PSU). I hate using e-bay as a pricing guide.

So, my question to the group: What does a TR-4 go for now days?? This is an un-tried rig. Not sure it works. Decent cosmetics, however, the previous owner said that the last time he had it plugged in that the rig didn't transmit. There is a TX/RX switch on the back (if I recall) and maybe that was in the wrong position, although I don't know for sure and he doesn't remember. There is no PSU (he sold it), so no way to ck it out prior to "doing the deal".

2nd question: How much for an AC-4? I know that there is a speaker enclosure that can house the AC-4, need nomenclature and an apporximate cost.

Thanks, gang....this is one COOL group!

Yep, Q3 is toast. There may be another problem aswell... The Collector voltage should be 11 VDC
with the Base less than 0.6V. The 27.4 VDC you are reading indicates that the Zener inside the PTO
may be open.

Need to determine the version. The collector resistorfor Q3 ... Is it a 2W carbon or 5.25W power
resistor?

Rich, it is a pig in a poke. So go easy. One sobering through is that if you need to re-tube it that will be about $200. Yes, tunes are not inexpensive.

"Will not transmit" could be simple, could be complex. If it is a plain old TR-4 - fine to shoot the breeze with - CW can be done and was all the time, but there are better TR-4 models.

I would err on the conservative side - perhaps $100-150. I am not a tight wad, but a lot could go into it. If you could bring an AC-4 along to test it - at least for reception, that would help out.

Good luck and keep us posted. A friend bought one at a certain exit on the Jersey Turnpike, and he had a great story to tell!

Rich,

I usually don't chime in on these price requests, but you are getting some high prices more like Ebay. The last answer ($100 to 150) is more like the offer I would make on a pig in a poke TR-4. The other prices you are getting are more the price for a TR4C to me. In fact, I bought a VERY nice TR4C with the extra 10M crystals and added a nice RV4C remote VFO to it for much less than $500 less than 5 years ago. I had an AC4, so I didn't get that or the MS-4 speaker. If you get the remote VFO, it has the speaker built in as well. Nice for casual use, but the twins are much better for steady use, IMHO.

Looks like a power resistor to me. Appears to be wire wound on a ceramic form encased in brown ceramic. There is a hole through the center from end to end. There is only one silver stripe on the end indicating 10% tolerance I suppose. It is a little smaller than the three carbon resistors on the same board which have the usual stripe color codes. Funny thing is that I received original Drake documentation with the RV-4C and on the schematic it shows the collector resistor as a 2 watt 15k. There is the number 20563 stamped on the rear of the chassis which I assume is a serial number?? Thanks for the assistance.

11721. Okay, I just bought this one

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 04:22:17 UTC
From: Dan Galligan
Topic: 11721 Message: 11721

I just made a deal to buy this TR-4, with 2-AC-4's. One working, one not, but including the new Hayseed AC-4 rebuild kit, for $300. The one not working, is only not working because of a hack job, of a repair. But, it doesn't have a cover. With new caps, it should be good as new. The ugly, but working one, looks like the case got smashed, then was pounded out, into something resembling being in shape, but lumpy as cottage cheese, on one side and top, with a tear in the aluminum, that now overlaps.

The TR-4, is going to be headed off to Jeff Covelli, by next week. Since I have 2 AC-4's, and one rebuild kit, I will have a spare. I don't think I want to sell it, but it is missing the cover. Anyone have a line on an AC-4 cover, or two? I figure to rebuild the ugly one, with the Hayseed kit, and get the Heathkit Shop kit, for the second one, that's missing the cover, altogether.

I agree with Don's sentiments.
Presuming the radio is in cosmetically good to excellent condition, and has not been hacked up by somebody with a golden screwdriver, I wouldn't pay a penny more than $150 knowing it was NOT working when parked. You have to assume the worst in these situations, if the 3 6JB6's alone are shot you're looking at another C note unless you stumble upon some for a steal. If it has the noise blanker option installed, (you have to look through the cover, don't be fooled simply by presence of the NB switch on the front panel), maybe $200. Download a copy of the manual and study the pictures before looking at the radio- we've all brought some piece of equipment home only to later discover somebody added a switch in the font panel, hacked up the chassis in a semi-professional manner, or something else that made it much worth much less than the "bargain" we thought we got.

AC-3 and AC-4 power supplies are around, expect to pay $100 or more for an as-is, but unmolested one. I have an AC-3 that I could probably be talked out of, should you strike out elsewhere.

Of course bargains are still out there, two years ago I bought an AC-4 in the MS-4 speaker cabinet at a hamfest for $50. Spotted it early in the morning, kept wandering by and never saw the seller at his table. Around noon when everyone was leaving, I caught him as he was nearly done packing up. Asked if he still had the speaker, and he dug it back out. Never had a radio, just the supply/speaker. I asked how much, he said $50, and we both left very happy campers!

Don't know what's been up with Drake stuff on ePay the last few years. Maybe it's just a peak in the market, maybe they're just finally getting the recognition they deserve.. Ask different people, you'll get different answers. In either event, buyer beware, ask lots of questions, and request pictures.

Good luck-

BTW,
Those who said that some of us overpriced the other TR-4, in question, were probably right. I elevated my estimate, because I didn't want to look like a total cheapskate.
The owner of the one I am buying, offered it for $250, but he's gotten the short end of a couple of other deals, so I insisted on paying $300. He's a real generous guy, and has far more than $350, into the radio, 2 AC-4's, and an AC-4 re-Cap kit. He's a GOOD friend, and I couldn't let him take it in the shorts, that badly.

Date: 2013-02-05 04:44:20 UTC
From: Rich Arland
Topic: 11710 Message: 11724

Tnx to all who have responded. That is why I like this group.

I will download the manual, do some homework, and be prepared to haggle. I'd like a TR-4 or 4C just for general SSB work. Nothing serious. Several years ago I had a chance to get a TR-4CW w/NB in exchange for a Yeasu FT-1500!! I, of course, did the deal, but never used the rig. Sold it about 4-5 months later as we needed money to do the move from PA to GA. Man, do I wish I still had that radio/PSU.

Again, thanks, gang. I appreciate all the info/help.

Rich!

Come on, fess up, you got the money. Spend some of it before it rots away in your pocket.

Most the prices guys were stating are pretty much in line with what I've spent.

I spent about $250 for a TR4CW several years ago and while it's slanted toward the cw op (thus the name! Duh!) it's not my cup of tea and now proudly sits on the floor of the shack.

Tubes are not that expensive. Granted the sweep tubes in the PA are, the 6HS6 can be but most are $3 to $5 bucks a copy. Now that being said, don't you dare run out and buy a tube set for one. First off, it won't fix a broke radio, and second, if you put in new tubes then the alignment will be so far out of whack, it will take you a month to get it back close.

if you can, look at the rack and see if the seals have been broken, if they are, it's good bet someone has been tweaking on the slug and things could be seriously screwed up.

Filter caps, most film capacitors, then the electrolytics should be replaced one at a time.

check the cathode resistors on the PA tubes. Check the screen resistors on the PA tubes. You don't need to break out the VOM, just look at 'em if possible. You've been around the block enough to know what a toasty resistor looks like.

Check things like the PTO gears. Does the pto turn smoothly? Backlash?

Most high value resistors usually drift up in value. Check a few and change as needed.

Clean tube sockets, controls and so on.

Call me when you need the AC4R power supply upgrade, and no you can't use a heathkit HP23 series supply, the plate voltage is way too high.

Hi Mikey:

As usual, you keep me grounded!! Thanks, Pard.

Hey, you wanna unload that TR-4CW? If so, lemme know and we'll do some business at FDIM/DAYTON. Seriously, Pard, I had a TR-4CW/PSU in trade for a Yaesu FT-1500 2M FM rig! Had it for 4-5 months and sold it to finance the move from PA to GA. Always wanted to try that rig out but never really had a chance.

Tnx for all the info. I have archived that e-mail and will use it when I eval the TR-4. Allegedly, the guy I am getting it from works with the guy who originally had it. The deal was that my guy (N4KD) was told by the owner that it would be "free" IF he took a Swan 350 also!! I told N4KD that I would take all the Swan 350s this guy had and trade them at Dayton. There are actually people out there that collect these rigs!! Had one in Japan (KA2AA) in the 70s and it was a hoot to use...they didn't call them "Swan Three-Drifties" for nothing!!!

Most the prices guys were stating are pretty much in line with what I've spent.

I spent about $250 for a TR4CW several years ago and while it's slanted toward the cw op (thus the name! Duh!) it's not my cup of tea and now proudly sits on the floor of the shack.

Tubes are not that expensive. Granted the sweep tubes in the PA are, the 6HS6 can be but most are $3 to $5 bucks a copy. Now that being said, don't you dare run out and buy a tube set for one. First off, it won't fix a broke radio, and second, if you put in new tubes then the alignment will be so far out of whack, it will take you a month to get it back close.

if you can, look at the rack and see if the seals have been broken, if they are, it's good bet someone has been tweaking on the slug and things could be seriously screwed up.

Filter caps, most film capacitors, then the electrolytics should be replaced one at a time.

check the cathode resistors on the PA tubes. Check the screen resistors on the PA tubes. You don't need to break out the VOM, just look at 'em if possible. You've been around the block enough to know what a toasty resistor looks like.

Check things like the PTO gears. Does the pto turn smoothly? Backlash?

Most high value resistors usually drift up in value. Check a few and change as needed.

Clean tube sockets, controls and so on.

Call me when you need the AC4R power supply upgrade, and no you can't use a heathkit HP23 series supply, the plate voltage is way too high.

Decent cosmetics, however, the previous owner said that the last time he had it plugged in that the rig didn't transmit. There is a TX/RX switch on the back (if I recall) and maybe that was in the wrong position, although I don't know for sure and he doesn't remember. There is no PSU (he sold it), so no way to ck it out prior to "doing the deal".

11727. 2B Tuning Knob

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 04:22:32 UTC
From: Mark Brueggemann
Topic: 11727 Message: 11727

Been casually looking around for a tuning knob for a 2B for a while and nothing's turned up. The one I have the chrome ring is rusted. I could entertain getting it re-plated but if used/good ones are around that'd be the direct route.

Any leads where I can find one? Thanks.

Mark K5LXP
Albuquerque, NM

11728. MN-1000 main tuning knob

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: Jim Larsen
Topic: 11727 Message: 11728

I am in need of a band switch knob for my MN-2000.

Can anyone help?

I was lucky to recently acquired a Drake TR4-CW & PS, RV-4C, MN-2000, C-4 and L4B. None have been restored yet but I am excited to see if I can get it all back on the air.

Thanks in advance.

Mine has a red noogie and I am very proud of it, even though it has faded some with age. So have I. So, I'll probably keep it.

Somehow, I don't see a p/n for "Noogie, red."

Hello List,

I have a 2B S/N 2765 and it doesn't have a hole for a red 'noggie' in the dial window. What is the hole size and maybe I will order a red 'noggie' and install one.

Everyone should have a red 'noggie' that doesn't have one!

Several have responded that the speaker housing is an MS4. There are 4 screw holes in the rear of the lower panel to hold the AC4. Do NOT ship as one unit, the MS4 cannot take the bouncing weight. Cost varies, based mainly on condition of the box.

The AC-4 as a generality will be between $50 and $100 (+ maybe) Depends on whether it has a power supply rebuild kit installed. One such example would be a Heathkit AC4-R. These are rather simple to install and you can google for a look see.
Good luck Carl wd8nhk

11733. Re: [DrakeRadio] RV4C

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 14:38:03 UTC
From: Garey Barrell
Topic: 11677 Message: 11733

George -

OK, that's an earlier schematic version and you have a late RV-4C. Attached is the correct manual/schematic from my service supplement CD.

I would suggest cutting the Collector lead of Q3 and measure the voltage at the input lead to the
PTO. As you can see, if it's much above 11V there is a problem inside the PTO. The 10V internal
Zener and/or the 10 uF electrolytic (C20) may have shorted. IF C20 shorts, R6 will overheat, going
upin value and eventually opening. Your 28 VDC reading makes me think the cap may be shorted.

Let me know what you find, or if I can help further.

rich,

it's like this.

prices are dictated by the market. If you're willing to pay $450 for a ac4 then there is someone willing to sell you one for that price.

This works for radios, cars, and even Twinkies on ebay.

When I'm looking for something, the first thing I ask myself is how much would "I" sell it for? I think I could sell a AC4R rebuilt AC4 for $175.

That's what my market says they are worth.

Topic: 11727 Message: 11738

Jim,

Congratulations on your recent 4 line purchase!!! With some care, that should last you a good, long time. If you don't already know about them, I highly recommend the CD sets that Garey Barrell sells to help you find components and know possible faults to look for in your sets. Go to www.k4oah.com and see what is offered. These are NOT just copies of manuals and schematics, but true service manuals for the gear.

Ask a lot of questions of this group as you go, I do, and I always get some tips to help me in my repairs. I'm afraid I have nearly one of every major rig Drake made (not really, but the place looks like it, hi). Again, welcome, Jim!!
73,
Don, WB5HAK

And if you're selling on eBay, "Buy it Now" is your friend. I've sold a dual voltage AC-4 for a lot more than a regular one using BIN and it sold in 2 days.

Check hamfests, Craigslist, and local sales. You may be pleasantly surprised at the prices you find! You can still find plenty of TR-4's for well under $200.

I agree with Rich, If not working but cables, transformer and case are in decent shape, then $75 or so. Remember shipping is brutal!

JTSTRS (just to set the record straight), Patrick "Red" Noogie was an Irish ham who got the nickname "Red" for his flaming red hair color(when he had hair), and was famed for convening the "Noogie-net," which catered to rag-chewing Irish Whiskey distillers who were Drake fans (not the kind that cools finals). Ridiculed for his insistence that the Ether theory was responsible for radio propagation, he became dispirited and left Ham Radio in 1961 to become a UFO researcher. Last sighted in Roswell, NM selling bumper stickers with the famous slogan "I want to believe," he disappeared into the (well, you know...). In his memory, Drake fans (not the kind that cools finals) everywhere began calling the red Dial Adjustment Pins "Noogies."

And now, you know the rest of the story...

11744. Drake TR4 Transmit Problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 20:14:02 UTC
From: tjb813
Topic: 11744 Message: 11744

I have a nice TR4, very clean, no mods that I can find. In SSB transmit with the gain set to 10 o'clock or higher, it will hang for 3-5 seconds after I let go of the mike key.

Anitvox - full up or zero - no change
Vox - set to zero - no change
Mike gain at zero while hanginging - no effect

It is not always consistent. SOmetimes it will work fine for an hour, then mess-up again.

I changed the Transmit AGC tube, checked voltages and resistor values.
I changed out the audio pre-amp tube.
I changed out the relay driver tube.

I have a sneaky feeling its a leaky cap in the VOX circuit.

Any idea what caps to test first?

It is a later model TR4, not C, CW, or CWRIT.

Thanks in advance for the help.

Tim KD8CN

Tim -

Check value of R105. Measure voltage at junction of R105 and R108. Should be at least -5V when PTT
key-up. Open D6 / D10?

Not ALL NOS 6EV7 are 'gas-free'. If you have one, try another.

11748. TR5

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 20:46:47 UTC
From: Woody
Topic: 3322 Message: 11748

Well here I am asking another TR5 question, my TR5 worked perfectly when I got it around a year ago then it started having problems on start up, when I turn it on it acts as though it is popping a circuit breaker, it comes up for an instant and then goes right back off, you can keep doing this and finally it will stay in and work flawlessly after it comes up. I use it on a PS7 and have another one on my 7 line so I've tried it on 2 different supplys and it does the same no matter which one its hooked up too. Any ideas
Thanks Again
Woody

11750. Removing PTO cover???

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-05 21:11:17 UTC
From: K4GM-George
Topic: 11750 Message: 11750

Is there a trick to removing the PTO cover? I disconnected the tension spring and attempted to squeeze the two clips but I don't feel any loosening of the cover. I don't want to force anything so have used only TLC so far but tonight I will try needle nosed pliers to squeeze top and bottom prongs simultaneously. Am I on the right track???

George -

Yes, they work just like the old IF cans. You can squeeze them together (_not too much_) enough to
clear ONE 'hook' then hold while you clear the other hook. It can help to put folded paper between
the bottom edge of the can and the back of the gearbox to keep one from slipping back in while
you're working on the other. Once one side is clear, do the other. I have a tiny (4") pair of angle
slip jaw pliers that makes it easier to controlthe pressure, AND limits the amount of compression.
They WILL break if pushed too far, but I've never broken one and I've pushed them pretty far!

I had a similar experience with my T4XC used with a D104 Silver Eagle mike. I suspect it would be very close to the TR4. I had the mike amp in the mike 'turned up' from a previous radio and it caused the PTT to hang up. After I turned the mike down to a normal level, all op ok. I was operating it in PTT(not VOX) when this problem happened. If you have an amplified mike try turning it down.

Good luck and 73,

Ski-WB8YXI

Hi Woody, Never had that one. Have had a lack of use on my TR5 it would not turn on, and it was a capacitor charging up after perhaps a year or so of non use, took multiple on offs.....always felt it was my power supply which is in my case the original PS 75. Carl wd8nhk

Talk about price! How can transformers cost so much ? (gasp) If it's a toasted xformer, might as well buy another AC-4, and use that one for parts

Be careful about "not working"

Could be a toasted transformer. Rare, but I've seen them.

Carl,

I've got two that were scanned by Kinko's. I've been wanting to re-do them
at higher resolution but haven't done that yet.

I'll put them in my Dropbox account and share them with you.

Mark,

Maybe you've done this already, but you might try some very fine steel wool on the rust and see how it does. Years ago I cleaned up a rusty chrome bicycle for my son that way and was amazed how well it worked.

Tom, AG9X

Subject: [DrakeRadio] 2B Tuning Knob
To: DrakeRadio@yahoogroups.com

Been casually looking around for a tuning knob for a 2B for a while and nothing's turned up. The one I have the chrome ring is rusted. I could entertain getting it re-plated but if used/good ones are around that'd be the direct route.

Any leads where I can find one? Thanks.

Garey...Sorry this has taken so long. When first tuned the output is stable for 10-15 minutes then starts down very slowly. I keep checking every couple of minutes so I think the problem is related to something heating up and changing value. I've been told there is a resistor in the PS section that supplies the voltage to unbalance the modulator to produce the carrier that goes through one section of the control pot. Not sure which one it is. Thanks....Tom

Tom -

More likely that the finals are gassy. When the output is dropping, is the PLATE current dropping
as well? After it's been running a while, and the output has dropped, check the idle current quickly.

Also check the value and condition of R26. Check R32, R33,these two should be within 5% of eachother.

R79 is the control for the unbalance of the BM. This is only used in CW to allow the CO to pass
through the BM. In TUNE mode, R84 controls the level of audio tone applied to the BM, which generates a single frequency SSB signal (appears as a CW signal) for adjusting the amount of drive.

11767. Case Screw sizes

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-06 19:59:01 UTC
From: Dan Galligan
Topic: 11767 Message: 11767

The TR-4 that I just purchased, is in need of a few case screws, so I thought I would buy all new ones, in a philips, pan head, rather than the original flat head. What is the size and thread pitch?

They're just plain 6-32 x /@1/4" head machine screws. Probably binder head. Why switch to Phillips, slotted ones are still common, in black even. Last I saw there was a ham on eBay selling lots of 50 for like $5.

I simply prefer the philips head, because they get buggered up, less than straight blade. If I have to buy some, I might as well get the ones that are easier to work with, and less likely to get buggered. This TR-4, only had 6 screws, total, holding it together.

You guys crack me up. Actually, since this is just going to be a play-toy, not a restoration, and the radio has some other cosmetic issues, I'm not too concerned about having the "wrong screws", as long as they are the right size.
Thanks to Chris, I will have a matching set of the correct sized screws, albeit "dastardly" Philips head, type. I'll have to go see the parish priest, and take confession, and ask for forgiveness, for that sin.

At least you're not having to source undercut 100-deg. flat-head Pozidrive 6-32's for HP gear. _Those_ are hard to find.

Thanks,
Barry - N4BUQ

Kris,

Those screws are 6/32, not 8/32. Lots of difference, hi.

Chris, saw your email about the screws for the Drake

My T4XC and R4 have mismatched screws including (ugh) shiny Phillips heads. I would like to take up your offer to the other fellow but would be glad to pay you for them. Can you do that?

If so, my mailing address is
Bob Logan, NZ5A
8712 Lone Tree Dr.
Manor, TX 78653.

Let me know your price and address and I'll send it right off.

I would appreciate it very much. I am proud of my Drakes. Thank you.

Bob

Bob,
The ones I have here at work are Phillips head, whereas the originals were slotted. Dan actually wanted Phillips head instead, thus my offer. I do not have any slotted ones, although I may buy a box from the fellow on eBay or McMaster Carr sometime for my Drakes.

If you don't care and still want the Phillips ones I have, send me a note off-list.

Regards,
Chris

Dan, do you mean the screws that hold the covers on? Those are panhead and not flathead.

If that's what you're looking for, they're 6-32 and 3/8" long, IIRC. There's a vendor on eBay who sells them 50/$5. I'm already on my second bag of 'em

11783. New question....

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-07 02:15:13 UTC
From: Dan Galligan
Topic: 11783 Message: 11783

Am in process of installing AC-4R kit, in AC-4, S/N 29288. The ends of the bolts, where the AC-4R standoffs are to mount, on the transformers, are on the opposite side, of the transformer, from the three capacitors I just removed. And, the underside is quite different from the photos in the kit.
It's been about 6 years, since I did one of these kits. Would I be better off, just removing the other two caps, from the side where the nuts thread onto the screws, and mount the PCB there? It looks like less room, and maybe will not fit. Or, should I un-install the transformer, and reverse it's position? Or, will the screws through the transformer body itself come out, so I can just reverse them?
Thanks for the input. I thought this was going to be a simple hour long job, like the last one. I guess not. Whatever I do, it's going to be long and arduous, me thinks.

Dan,

I had to reverse the screws (bolts) on the transformer to put the one in that I did as well. It was a later serial number as yours is, so not sure if that makes a difference or not. I noticed no humm or vibrations with the transformer after that, so no ill effects to doing that unless someone knows more than I do about the transformers (entirely likely).

Dan,

I had the same problem on one of the AC-4's I did. Loosen the nuts enough that they cover the ends of the threads. Then tap the nuts lightly so that the screw heads will break through the paint or varnish coating and start coming out. The reason for covering the threads with the nuts is to avoid damaging the threads with your hamer, etc. Remove the screw. Then you can reverse the screw position on the xfmr. Do one screw & nut at a time and everything will stay aligned.

73 & good luck - Bill

Don,
I'm having difficulty getting one of the screws to budge. I got the nut and star washer off, but the machine screw doesn't want to budge, even with some fairly solid tapping, on the thread end, with a screwdriver handle.
It looks like the board, with the standoffs installed, WILL BE too long for the opposite side of the transformer. I tend to think I am relegated to removal and reversal of the transformer. So I just took lots of digital photos.
Wish me luck!

Can you get a screwdriver on the side of the transformer with a "head" on it?? I am thinking I may have had to "screw" one of the screws out of mine too, like it wasn't drilled the proper size.

Don,
I'm having difficulty getting one of the screws to budge. I got the nut and star washer off, but the machine screw doesn't want to budge, even with some fairly solid tapping, on the thread end, with a screwdriver handle.
It looks like the board, with the standoffs installed, WILL BE too long for the opposite side of the transformer. I tend to think I am relegated to removal and reversal of the transformer. So I just took lots of digital photos.
Wish me luck!

Don't do that!

Just mount the pcb on the end with the nuts.

Or.

Use "l" brackets to mount the pcb.

Or

Mount the pcb to the end wall of the chassis.

Don't rotate the transformer!
Way too much work
Too easy to mess up the wiring.

Dan,

The screw heads might be covered in varnish or paint. You might have to break off that varnish or paint first. A center punch can be used to clear the varnish out of the screw head slot. Then you can use a flat blade bit from one of those driver bit sets and a 1/4 inch wrench to turn the screw head to loosen it. You might also be able to use the punch or a small chisel

to chip away the varnish around the head.

Another thing that might work is to screw the standoff on to the bolt but not all the way. Then turn the nut up against the standoff and tighten with a wrench. A lockwasher between the two would be great if there is enough room. Then turn the standoff to get the bolt to turn.

Dan, do you mean the screws that hold the covers on? Those are panhead and not flathead.

If that's what you're looking for, they're 6-32 and 3/8" long, IIRC. There's a vendor on eBay who sells them 50/$5. I'm already on my second bag of 'em

The TR-4 that I just purchased, is in need of a few case screws, so I thought I would buy all new ones, in a philips, pan head, rather than the original flat head. What is the size and thread pitch?

I seem to recall from the instructions that many of the screws will not budge at all. He recommended mounting on the other side - which requires removal of the original caps.

The Transformer rotation seems to be a viable alternative. Mark the wires and remember that they're equivalent (two yellow, two red, etc.).

I still have a set of instructions. I removed the old
caps from mine, they serve no purpose and take up space. The
holes in the chassis are useful for running wires. What I
remember is that the instructions for assembling the circuit
board are fine but the instructions for installing it leave
a lot to be desired. I don't remember exactly what I found
but I do remember that mounting the board on the transformer
required some body English. I think I had to remove the
transformer mounting screws so I could tilt it a bit.

Gang,

like I said,

Don't remove the transformer and flip it. It's not a good idea!

The wires are old, the wires won't reach back to where they were connected. You'll have a mess on your hands.

install the pcb on the end that has the threaded transformer screws.

The red and yellow wires supplied in the kit will be too long, while the blue and green wires will be too short.

Or move the pcb to the end cap, drill four holes, and mount the pcb to the end.

A lot of guys use "L" brackets to mount the pcb to and that works great! There is a photo of that in the manual

Okay. I got the transformer, rotated, and rewired, properly. Now I found something that I either should have checked first, or if I had taken Joe and Mike's advice, and mounted it on the end of the chassis, I would have avoided the work. It wasn't difficult, just time consuming, and tedious. For some unknown reason, this transformer has larger machine screws, with a completely different thread pitch. The standoffs will not thread on, and when I looked at a standoff, next to one of the machine screws, it was OBVIOUS that I was dealing with a different size screw. The standoffs are a 32 thread count pitch, and the screws holding the transformer together are a 24 thread count pitch.

So, now I am forced to do it Joe's way. I liked his idea, but I didn't want to actually modify the case. A drilled hole, can never really be refilled.

Thanks, for all of the information.

This is getting ridiculous. The kit, does not fit, even with it mounted on the end. it is a good 1/4" to 3/16" shy of fitting in the intended location. I opened up the other AC-4, that I got with this radio, and it has a smaller transformer winding, by about 3/16", per side.

Did Drake use different transformers, from different suppliers, over time?

I am going to have to go to my local special fastener store, and buy some standoffs, that are maybe 3/8" shorter than those that came with the AC-4R kit.

Doggonnit, this is frustrating.

I still have a set of instructions. I removed the old
caps from mine, they serve no purpose and take up space. The
holes in the chassis are useful for running wires. What I
remember is that the instructions for assembling the circuit
board are fine but the instructions for installing it leave
a lot to be desired. I don't remember exactly what I found
but I do remember that mounting the board on the transformer
required some body English. I think I had to remove the
transformer mounting screws so I could tilt it a bit.

Mounting the board is where my field service experience came in handy: I knew to leave the standoffs loosely attached until everything was more or less together.

The wiring instructions are the way they are because there seem to be some supplies with different colors in the wiring. Trying to describe wire routing is a verbal minefield. I know this from writing tech bulletins and ECO's. Pics are always better and assembly drawings best.

Dan, you could try re-tapping the threads in the standoffs. Won't be the neatest but will probably hold. Alternative is to get some standoffs in the correct size.

Subject: Re: [DrakeRadio] New question....

Okay. I got the transformer, rotated, and rewired, properly. Now I found something that I either should have checked first, or if I had taken Joe and Mike's advice, and mounted it on the end of the chassis, I would have avoided the work. It wasn't difficult, just time consuming, and tedious. For some unknown reason, this transformer has larger machine screws, with a completely different thread pitch. The standoffs will not thread on, and when I looked at a standoff, next to one of the machine screws, it was OBVIOUS that I was dealing with a different size screw. The standoffs are a 32 thread count pitch, and the screws holding the transformer together are a 24 thread count pitch.

So, now I am forced to do it Joe's way. I liked his idea, but I didn't want to actually modify the case. A drilled hole, can never really be refilled.

Thanks, for all of the information.

One note that I don't think has been mentioned, Jackson 600-series tube testers used a very similar knob style as the 2-line receivers. I don't know if the big knobs are close enough for you tuning knob, but many of the small knobs look like exact matches. If you can find , i.e., a Jackson 658 in good condition, I don't think people would get as wound up about snitching the knobs as if it were a classic radio.... ;)

I just went down to my commercial screw and fastener supply and bought the standoff's and screws. $5.00 and I purchased several sizes, just in case my measurements were off a bit...I know I didn't use any of the stand-offs that came in the kit. I marked the spots to drill the holes before I built the PCB and center punched each spot so the drill would be accurate. Yeah I know, for purists, it violates the appearance of the supply, but it is mounted inside the speaker housing, so I wasn't concerned about that. (The different colored wiring *was* an issue though.....fortunately, I had a second supply I could refer to so mental crisis averted! HEH.)

From: Dan Galligan
Topic: 11809 Message: 11809

After rotating the transformer, I went to install it, leaving the standoffs very loosely attached to the board. No-go. The two 150uF/450v caps at the top of this board, are longer and narrower, than those in Joe's photos. My transformer doesn't seem to be as old, or as large as Joe's, and is completely coated in black wax/tar, of some sort.
I have the holes drilled, for end of case installation, and I moved the terminal lug strips, to the same locations on the underside, as are shown in the installation instructions. I am certain that I got the wires back to the correct lugs, on the terminals. I DID have to lengthen a couple of the wires. Thankfully, I have plenty of wire, solder and heat shrink tubing.
But, still no fit. It must be the length issue on the two 150uF/450v caps. So, before I try anything else, I will do as Joe suggested, and take a trip to King Bolt, the local fastener superstore, and buy more standoffs, of shorter lengths, to install this. Thank goodness this AC-4R kit came, included with the radio, or I would be pitching a fit, right now, with the maker.
The friend whom I bought this from, bought the pre-assembled kit, so I'm not sure what he spent. Whatever it was, it was too much for this much trouble.
Thanks for all of the help and suggestions.

If clearance is that much of an issue, why not just use some thick nylon washers between the PCB and the chassis and use ordinary screws?

Barry,
It may come down to that. I even thought of putting a thin later of dense foam rubber in there, and then screws, to hold it in place. Or, even some good 3M double sided mounting tape. But, since it will only be a few bucks, I think I'll try the shorter standoffs, first. But, yes. Your suggestion, is definitely another option.

Holy career out of a project, batman! Sounds like you've created a nightmare!
Maybe I'm missing something, but didn't this whole thing stem from the screws holding the transformer together being on the "wrong" side? Will the kit not fit where it was originally intended, if you got the screws out? If they're stuck in place and won't TAP out, then try unscrewing them. If the laminations or bells are pinching them in that tight, they ought to simply unscrew once the nuts are removed, as if it were a threaded hole.

11813. FS TR3

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-07 19:58:57 UTC
From: hglent
Topic: 11813 Message: 11813

I recently acquired a TR3 setup from a SKs widow. It is about a 7 cosmetically with the usual chassis dirt. I have had this rig on 40 and 10 meters SSB with excellent reports.

In addition I got a home brew AC Power Supply with it. The SK was a engineer in Oak Ridge, and the power supply reflects his expertise and skills. The design and selection of parts is superb and his construction practices among the best I've ever seen.

As usual, when dealing with a bereaved spouse, I paid too much for the setup. I figured I would offer it here to fellow Drake enthusiasts before putting it on Ebay.

If you have any interest in this TR3 set up please contact me off list wa0bag@...

Chris, each transformer has it own set of issues..on mine, the screws were cut off at the nut, and the flared (pinched) and of the screw, prevented the removal of the nut. I wasn't about to spend 5 days getting 4 nuts off and then finding long screws to replace the damaged ones. Drilling the holes in the end of the case and mounting the kit there was the quickest, easiest, and most secure way of doing things, in my book. Having spent time in the service, I believe wholeheartedly in the K.I.S.S. method of doing things!

Chris,
I tried to remove them, with the nuts removed, and the transformer out of the case, but they simply will not budge. The heads were starting to peen over, from the (proper sized) straight blade screwdriver, that's when I decided to simply mount it on the end. Beside, the standoffs, which were included, were a completely different thread size and pitch, pattern.

But, no, it simply will not fit, in the location it was supposed to fit, unless I use standoffs AT LEAST 1/4" shorter. So, now that the holes are drilled in the end of the case, I'll just use shorter standoffs, and it will be done.

But, the other AC-4 that I have here in CA, and one of the two, at my house in OK, will be getting a kit, that one of the members here, is designing. I am not going to be a fan of the Heathkit Shop's kit, henceforth. The one I did the Hayseed kit on, turned out nice, and the owner is very happy with it. But Tom's kit is designed to replicate the original look, and has some specially made can caps, therefore, it costs even more than the Heathkit Shop's kit.

Dan,

I charge $15 to assemble the kit.

I think that's a fair price for an hour of bench time.

The 150 mfd caps are the same ones I've used in over a thousand ac4r kits.

There should not be a fitment problem.

Hi all,

Considering all the ruckus.

I have a nice functional AC4 power supply, SN 34607 that I can sell as I do not use it anymore. All of my 3 & 4 stuff has gone away, and I just sold the other one (with an AC4-R kit installed) to a fellow ham not long ago. Had two 3's including one of the originals a while back ...geez that's years.

All original insides, the bolts in the transformer are turned the correct way for your AC4-R kit when you decide to. I can pull the nuts off if you like and check thread size.

The cables are all in good shape. There are four Drake plastic feet on the bottom. All phillips head screws (not black)
The case is not bent up, pictures if you like. I just took the cover off to make sure of the transformer screw orientation. So right now its off.

The price is $100 plus shipping. Now if you want the AC4-R kit already installed it will be $200 plus shipping.
We can work around the shipping if you want to pick it up at the Dayton Hamvention.

Mike,
I did one, several years ago, without a hitch. This one, was bought per-assembled by N6DPG. I went to install it last night, and the results have been chronicled here.
I have no doubt that it will work well, but, there is a DEFINITE figment issue. I don't know if that issue is on your end, or that of Drake, or possibly that the transformer was replaced. Any way it goes, it doesn't fit with the standoffs that were supplied. I took out a small ruler, and it is between 3/16" and 1/4" too long at the two caps I mentioned. If you look at the pictures which Joe posted in files, his are shorter, in relationship to the other caps in the picture. Mine are DISTINCTLY longer, and it doesn't fit. I understand that the design is a tight fit, and there requires a bit of finagling, to get it in place. But when I measure the length of the standoffs, and add that to the size of the assembled board. It is MORE THAN 3/16" too long.
Based on the obvious fact that it is a tight fit, and the bolts, used by the transformer manufacturer, are not consistent, I am simply going to try a different option on the next two AC-4's that I need to do. Not your fault. Nothing that is made to be a "One size fits all" actually does, fit all. There are always exceptions. It's not your design. It's simply a matter of difference in the product it is designed to go in.

Dan

Would you like me to send you a pair of shorter caps?

They're about an half an inch maybe shorter but rated at the original value of 120 mfd.

I have some 1/4 inch standoff I can send if that would help.

Here a hint if you mounted the pcb on the end cap. Mount the standoffs first leaving them loose then slip in the pcb.

And while I guess it's too late the pcb should be mounted toward the top of the end cap as high as possible.

Like I said I've sold over a thousand of these kits. 90% of the problems can be traced to wiring issues. Drake simply didn't use he same color if wire or even the way the supply had been wire.

Your problem with fitment is the first one had I heard about.

Bottom line is simple.

I want you to be happy with my product

>>
>> They're about an half an inch maybe shorter but rated at the original value of 120 mfd.
>>
>> I have some 1/4 inch standoff I can send if that would help.
>
> It will be easier for me to just grab some at the store I mentioned.
>>
>> Here a hint if you mounted the pcb on the end cap. Mount the standoffs first leaving them loose then slip in the pcb.
>
> Tried that too, that was an even more impossible fit, than very loosely mounting the screws to the PCB, and trying to get it in. Believe me, I tried every possible method, without modifying the board, or standoffs, before I measured. The measurement is clear, that it will not fit. It is, most definitely, nearly 1/4" too long at those two caps.
>>
>> And while I guess it's too late the pcb should be mounted toward the top of the end cap as high as possible.
>
> Yes, it is. I had the thought in mind, when I went to try that method that if it were tight, maybe I could mount it above the transformer windings. No go.
>>
>> Like I said I've sold over a thousand of these kits. 90% of the problems can be traced to wiring issues. Drake simply didn't use he same color if wire or even the way the supply had been wire.

>>
>> I want you to be happy with my product
>
> Mike, once it is installed, and properly working, I am certain that I will be happy with it. My only reason for trying the other design, is because it has been offered at a price

better than your's, as I will be a "guinea pig", and the designer says he believes it will run relatively cooler. So, it's worth a shot.
>>
>> Mike wb8vge. The heathkitshop.
> Thanks for expeditiously trying to rectify the issue. I don't believe it is your fault. My best guess is that Drake likely had transformers coming from multiple sources, and mine in one of a few anomalies. The terminal lug strips, on the underside were not positioned anywhere near what your photos showed, but were still easy to identify, and the holes were there, for me to move them to where they show in your photos, making for a better installation, in my estimation.

```

NOT made a drawing of the old wiring first. I had some difficulty in figuring out what went where. This is probably due to Drake having made different versions of the supply. I don't remember about fitting the circuit board to the transformer but I think it went on OK. There was enough wire in the kit to fix the wiring, I think actually I re-used more than the kit instructions indicated that I could. I also removed all the old caps and other unused parts.
I did get misled by the voltages; those in my supply and in another modified by someone else, are lower than indicated in the instructions. I think those are a bit optimistic. The modified supply works fine and has been in service for a while now. I would certainly buy another kit if I got another AC-4.

11831. Re: AC-4, For sale

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-08 02:52:28 UTC
From: Dan Galligan
Topic: 11831 Message: 11831

I believe that if one used good, dense foam, to pack it in, an AC-4, will fit in a USPS Priority Mail Large Flat Rate Box. That is a bit over $16.00 to ship, plus insurance.
I have found (told by another member here) that using those long round, colorful, dense foam tube, swimming pool toys, that can be had for a couple of bucks at discount retailers, and pool supply places, make wonderful packing material. And those flat rate boxes are the best, for shipping heavy, smaller items.

Is it possible that when the transformer was baked the varnish sealed
the screws too? Either when new, or if it had some vibration, maybe some
other owner before you?

If so, heating it might loosen up the screws enough to remove them
before they cool down.

Combination rig. My understanding is that the original TR-44 was an R-4A and a T-4 exciter in one cabinet. I've had some tell me the TR-44C is not real, others said yes it is. The early versions actually were marked TR-44.

That is entirely plausible. But this one seems more like it is a thick coating of wax, or some black tar like substance, over that. I'll try to upload some photos, to the Yahoo page, and y'all can see what I have here.
My problem is using Photobucket. I use it so little, that I always forget how to log in.

From: Don Cunningham
Topic: 11809 Message: 11835

Someone might have put an AC3 transformer in that AC4 along the way. If I remember correctly, the AC3 transformer looked like it had been made, then tar poured over the thing. Possibly Drake had some leftovers and used them. STRANGE things happen to ham gear over the years.

I thought RigReference.com had one, but not. RigPix has what they call a TR-44, here:
http://www.rigpix.com/drake/tr44.htm
And WB4HFN, has this TR-44B
http://www.wb4hfn.com/DRAKE/DrakeEquipmentPictures/Equip_TR44B.htm
But, I find only one reference to a TR-44C, in a google search, from QRZ, here:
http://www.google.com/#sclient=tablet-gws&hl=en&tbo=d&q=drake+tr-44c&oq=drake+tr-44c&gs_l=tablet-gws.12..0i10i30.5830.15034.0.17790.14.12.1.1.1.0.386.1699.3j8j0j1.12.0.les%3B..0.0...1ac.1.2.tablet-gws.tZ4Vd4GbXmY&pbx=1&bav=on.2,or.r_gc.r_pw.&fp=246257471b9ba6ae&biw=1024&bih=673&biv=i%7C0;d%7C56_N-phcolQRXM:

Dan,

I am a long way South of I-40, nearly to the Red River, so that's probably not workable for either of us, hi. I have forgotten where you are going to live, but I have a daughter in Tulsa and that may put me closer to you.

I posted photos on the Yahoo page, showing the standoffs being too long. I don't want anyone to think I was disparaging Mike's work, or craftsmanship. I believe it was the fault of the transformer, being other than standard, and NOT Mike's Heathkit Shop Kit design, but it definitely, does not fit.
Anyone who cares to look, and maybe point out where I may be wrong, is welcome to do so. In the mean time, I'm going to King Bolt, for the shorter standoffs.

Some transformers, notably those is much General Radio equipment, appear to have been dipped in a coating which forms a hard layer around the unit. I don't remember ever seeing soft tar-like material on an open frame transformer or choke except where it was an impregnant cooked out by overloading. Tar like material is used as a potting compound in canned transformers and chokes. I don't know exactly what it is but it looks like a mixture of waxes and asphalt. I've seen this stuff leak out of overheated transformers that were supposed to be sealed. Its possible the pressure inside was sufficient to create leaks. The hard coating on the GR transformers probably serves to seal them from moisture pretty effectively without having to seal them in a can.

Richard,
This one is more like it was dipped in something, to seal it. It is reasonably even, over all surfaces of the transformer, except the tabs to mount the transformer to the case. And, as best we could tell, it was working. Then, one of the badly substituted capacitors, shorted, and immediately blew a fuse. Comparing it to the other AC-4 that I have here, this transformer is physically bigger. I must presume it is either a replacement, or one from a Drake supplier, who was not used often. Too long of a story, but I had posted several pictures, several months ago, when Danny bought the AC-4, and found the faulty repair work.

Your transformer looks identical to the one in my (late style, s/n 20051) AC-3. Dimensions are 4 1/2" by (2 1/2" wide core, about 4 1/4" overall) by 3 13/16 tall. Do these dimensions match your transformer?
Just pulled the cover on an AC-4 that needs some work (s/n 43365), and its transformer is about 1/2" wider than that of the AC-3's. 4 1/2" by (2 3/4" core, about 4 3/4" overall) by 3 13/16 tall. Physical construction looks to be the same between both transformers, the later one lacks the black pitch coating.
If someone (Drake or otherwise) did indeed install the slightly smaller AC-3 in your AC-4, it makes no sense why the Heathkit shop board would not physically fit. Will it, instead, NOT fit in my stock AC-4 which has larger iron? This is all assuming the mounting holes are in the same location on all supplies.
Regards,Chris

Most of the military comm equipment I saw in the 60's was Collins gear, but I seem to remember... that the TR-44 was developed for certain nameless gov't agencies. The reason escapes me, except that perhaps it would be easier to grab and run if you had to, rather than destroy it, which is easier to put in an ops manual than to do.

OK Guys – time to set the record straight.

The rig sold on the auction site is as described; CA-1 stacking cabinet containing a T-4XC and R-4C – it is not a TR-44C. Prices like that make it tough to hang to my similar set!

However, there really is a TR-44C, like the much more common TR-44B, but with a T-4C reciter and R-4C receiver in a CA-1 stacking cabinet. The T-4C has an access door on the side for the TX crystal deck and a xtal switch on the front with many more positions than the T-4XC. The xtals are not used to generate band ranges but actual tx frequencies, much as the VFO does in a T-4XC. A speaker takes the place of the tx VFO and dial. And it SAYS "TR-44C" on the label plate on the side. I know of only three of these seemingly rare Drake pieces – Sindre's, mine, and another that W8DRZ owned for a while, but was sold some years ago. I am sure there are more out there somewhere. Maybe this thread will bring them out! There were clues with mine that suggested it was originally used as a communication station at an Austrian embassy in Cairo, Egypt.

I'll try and post pictures in several days – having surgery tomorrow so unable to do so right away.

From: DRogers
Topic: 11825 Message: 11845

I saw an original TR-44 when I was in college in San Jose, CA, in the very early '70's. It was the R4 receiver and the T4 "Reciter". The "Reciter" was essentially a T4x minus the vfo and the whole operation was run with the R4 vfo. It was in a stacked cabinet that had slots for each unit, the Reciter above the R4. I thought they were very cool -- I was just getting my license at the time and I believe that it was at Quement Electronics on Bascom Avenue. And, needless to say, I couldn't afford to buy it.

The TR-44B was advertised, but I never saw one. If I remember correctly -- an increasingly infrequent event -- the TR-44B "Reciter" portion stated that it was a "Transmitting Adapter" rather than having the Reciter title.

The only pictures I've ever seen of any TR-44C's appeared to be an R4C and a T4XC in a similar stacked case, but I couldn't see any reason for its existence other than for the compact look and I have always doubted that Drake presented them that way. I.e., I've always assumed they were put together that way later in their lives.

For what it is worth . . . .

Most old tv transformers that I remember had full metal covering.....

However the one in mine is paint labeled Cin-tran & #'s and I am thinking
the last Drake source was named something that fit that nomenclature.
Maybe others can verify. I have had four PS's and cannot remember that
printing on the rest. Carl wd8nhk

OK - I thought I'd scrounged some transformers that were similar in size and had multiple windings. The 700V supply actually comes off a 350V winding, so I suspect there could be something else "out there" that could have been pressed into service.

11852. Re :Drake Comm Stations

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-08 14:35:14 UTC
From: VE3AX/7
Topic: 11825 Message: 11852

Dave and all;

You are right about the original “TR-44” though I have never seen one actually labeled as such. Those I have seen (including mine) were just made up from a T-4 Reciter, and an R-4, or maybe later an R-4A, and a CA-1 stacking cabinet. The T-4 Reciter did not have a built in speaker in place of the PTO like the “T-4B” and T-4C Reciters used in the TR-44B and TR-44C Comm Stations. I also do not remember seeing any T-4B’s sold separately with the speaker. There was a T-4C Reciter sold by a W8 at Dayton last year (I was not there) – he had listed it on the Collins reflector along with several Collins pieces prior to the event. He was supposed to send me a pic but never did. That is the only T-4C I have heard of outside the TR-44C Comm Stations. They certainly seem like pretty scarce pieces.

The CA-1 stacking cabinet looks more like the top cabinet of the receiver with bottom part of the cabinet of the transmitter welded to the top. It’s not really a 2 part shelf as it appears. The tx, or reciter, goes on top. In the Comm Stations, Drake modified the T-4B and T-4C Reciters top cabinets to add a multi-position xtal deck on the side for tx frequency that could be switched in from the front panel. the T-4 Reciter does not have this xtal deck, but not sure if the standalone T-4B or T-4C had that or not. Maybe the fellow who purchased the T-4C at Dayton is lurking here and can shed light on whether it has the xtal deck on the side and the front panel speaker...or not. Just curious!

I checked Sindre’s web site last night for pics of the Comm Stations but he does not have that part of the site operational yet.

Off to the hospital...will post some pics next week.

Subject: Re: [DrakeRadio] Holy Cha-ching, Batman!

I saw an original TR-44 when I was in college in San Jose, CA, in the very early '70's. It was the R4 receiver and the T4 "Reciter". The "Reciter" was essentially a T4x minus the vfo and the whole operation was run with the R4 vfo. It was in a stacked cabinet that had slots for each unit, the Reciter above the R4. I thought they were very cool -- I was just getting my license at the time and I believe that it was at Quement Electronics on Bascom Avenue. And, needless to say, I couldn't afford to buy it.

The TR-44B was advertised, but I never saw one. If I remember correctly -- an increasingly infrequent event -- the TR-44B "Reciter" portion stated that it was a "Transmitting Adapter" rather than having the Reciter title.

The only pictures I've ever seen of any TR-44C's appeared to be an R4C and a T4XC in a similar stacked case, but I couldn't see any reason for its existence other than for the compact look and I have always doubted that Drake presented them that way. I.e., I've always assumed they were put together that way later in their lives.

For what it is worth . . . .

Most of the military comm equipment I saw in the 60's was Collins gear, but
I seem to remember... that the TR-44 was developed for certain nameless
gov't agencies. The reason escapes me, except that perhaps it would be
easier to grab and run if you had to, rather than destroy it, which is
easier to put in an ops manual than to do.

Topic: 11853 Message: 11853

Hi, I am new to Drake equipment and I would like some advice from the experts on here.

Is this item 370754014787, shown for sale on eBay an actual TR7 noise Blanker. It does not look to me as though it has enough parts do do the job. Apologies to the seller if it is actually what he says.

Clive -

Welcome to the group!

You are correct, that is NOT a Noise Blanker. That is a bilateral switch that is installed 'inplace
of' a noise blankerwhen no blanker is included.

In my experience fixing many things mechanical I've learned that often rather than struggle to remove a stubborn fastener, it is easier to deal with it by tightening it to the point of failure. Bust it clean, remove the debris and start fresh.

>
> However, there really is a TR-44C, like the much more common TR-44B, but with a T-4C reciter and R-4C receiver in a CA-1 stacking cabinet. The T-4C has an access door on the side for the TX crystal deck and a xtal switch on the front with many more positions than the T-4XC. The xtals are not used to generate band ranges but actual tx frequencies, much as the VFO does in a T-4XC. A speaker takes the place of the tx VFO and dial. And it SAYS “TR-44C” on the label plate on the side. I know of only three of these seemingly rare Drake pieces – Sindre’s, mine, and another that W8DRZ owned for a while, but was sold some years ago. I am sure there are more out there somewhere. Maybe this thread will bring them out! There were clues with mine that suggested it was originally used as a communication station at an Austrian embassy in Cairo, Egypt.

Steve -

Here are some AC-4 notes that may help.

Your transformer actually 'looks' right. Most Drake transformers were made by a company called
Cin-Tran, and the higher power ones had that epoxy 'dipped' coating. I doubt that this is a 'generic' replacement. Possibly anavailability problemfor the E / I cores?? Drake ran into many 'not
available in production quantities' in the later stages of C-Linemanufacture. Brass dial gears,
6FQ7, ...?

I've been sorta following this thread, and I wonder if the 'VGE board had the wrong capacitors
installed?

Reasonable to assume someone bought a NB, took out the "plug" and put it back in the box the NB came in. Box gets sold with an estate. Buyer of the estate sees box, doesn't know what it is, but paperwork says its a NB for a TR7 and, well, you see the rest.

Thanks,
Barry - N4BUQ

Carl -

Dunno, never seen one! Generally speaking, all the Drake NBs are a single design, just implemented
with different components. The NB-7 v2 that was used in the R-7 was a little more elaborate,
including a crystal filter, but still the same circuit.

The mechanical stuff would probably what would trip you up, but hard to say without having even a
photo of an NB-5.

HI Paul, I have just sent a message to the seller. Of course a bit soon to expect a reply. Just in case anyone is interested in a TR7 Noise blanker, beware! The item number is 370754014787 it is possible the seller has but the wrong image on his advert, but it's better to be safe than sorry. I will get back on here with the result of my email to the seller.

11871. Issue with my TR7 at power-up

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-08 16:33:24 UTC
From: w9dz
Topic: 11871 Message: 11871

I inherited my dad's TR7 when he passed last April. It has seen little use and has only been powered up a couple times in the last 10 years.

When I initially power it up the displayed frequency on all bands except 7 Mhz and 5 Mhz is 1 Mhz low. After it is on 15 or 20 minutes the frequency is normal and the rig seems to be fine on both xmit and receive.

I have reseated all of the boards but that hasn't helped.

Any ideas?

Thanks.

Allen, W9DZ

Hello

I have pictures of my AC4R. See here under Drake <http://67.121.147.138>

You want the circuit board trace to face the transformer and the mounted parts

facing the side of the cabinet.

Thanks. I would've figured "matte" so as not have too many interior reflections but "semi" is plausible as well. Matching the lustre will add a bit of a challenge using just spraycans but this gives me something to go on.

This is *exactly* how my recently acquired TR-7 arrived. Now all I need is an SL-500 in an SL-500 box...

I have a TR-44B which is a very cool assembly. I have been a Drake fan since I have been a ham (1977). I have owned almost every type of Drake tube rig made. The only Drake I purchased new was a complete TR7 station...

I recently purchased my TR-44B which the first and only time that I have ever seen this configuration, in true TR-44 form.

It is pretty cool... It is in decent shape, however, I do plan on a full restore in an attempt to bring it back to "mint shape".

I found a TR-44B brochure online that I uploaded to the files section of this group here;

http://f1.grp.yahoofs.com/v1/ID0VUYNjQ5o-sf0Gwm5r46QKe3lLSarz8I5MuQGc3EZ9r5wfQkkXAHArbx5dMVuUsL9lJF36vRN4ap9THZLiu5U5VVnIrJ_a8iZA/TR-44B.jpg

I hope this helps.

11877. TR7 - a useful alignment procedure change

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-08 19:41:26 UTC
From: floydsense
Topic: 11877 Message: 11877

I was working on a special project involving the TR7 Up Converter board and stumbled across something I thought I'd pass along to TR7 owners who work on their own transceivers.

The Up Converter board is buried under the shield beneath the digital readout board and is used on both transmit and receive. I have two boards, one marked 1977 and the other marked 1979. The older board has just two grounding fingers (on the connector edge), while the newer board has a total of 6 grounding fingers along with a very different ground plane on the board.

The Service Manual alignment process has you peak capacitor C418 (on the Up Converter board) for maximum S meter reading of the calibrator signal. I found that on the older board, the peak setting for C418 was different on transmit and receive and while the peak was rather broad on receive, it was much sharper on transmit. After peaking C418 on transmit, I found that I had 20 watts more output on 10 meters than when the the cap was peaked on receive.

So, the next time you run through the alignment, try peaking the cap on transmit instead of receive, particularly if you're unhappy with the maximum power you can achieve on 10 meters. C418 is accessed via a hole in the digital readout board, so is fairly easy to get to.

There's no easy way to tell which version of the Up Converter board you have without taking it out, but on the cards I have, the newer one has no insulation over the signal coax shield while the older card uses the grey covered coax. It also appears that the coax on the new card is a bit larger in diameter than the older card.

I would agree with it being between a matte and satin finish. Definitely not a semi-gloss, at least the ones I've had apart.

Wasn't this panel born more of an off-white though? Almost cream colored? Seems a stark white would be much too bright compared to one that has not been repainted.

Hi Woody,
Do you still happen to have the lid off of the TR5 ?
If so do you happen to have an NB5 noise blanker in it?
If so could I con you into taking some decent photos of the NB5 (digital
?) and sending to me.

Mine is definitely yellowed, especially when contrasted to the S-meter face. Compounding the problem is the rust and stains from being submerged in a flooded basement (!). You could say this one's a "fixer-upper".

Mark
Mine was mostly flat before I repainted it. Had a lot of nicotine stain and it was yellowed....Simple Green did a good job cleaning it and I went
to WalMart and bought a spray can of flat paint...it was not a pure bright white....forget what it was exactly. In bright light the panel looks less
white than the S-meter.
I repainted the cabinet with Krylon spray Satin finish black paint. Looks very good. Cleaned and polished the knobs, and painted the little
arrows silver. Looks very good. Got a new noogie too. And bulbs too.

Yes, that used to work
Nozzles now have that EZ touch fan pattern feature and it is darn near impossible to develop the light touch for spattering. If you drill the hole hardly at all you get glob finish
To do this MN-2000 job it had to match someone's original 4 Line gear and I made test panels of every flat, semi flat, semi gloss, satin finish paint I could find in the numerous auto and diy stores after learning that the old standard Krylon 1613 is NO LONGER AVAILABLE no matter what the Krylon website says about satin 51613 being the same. NOT TRUE. And if you order some on the internet billed as 1613 you will receive 51613 and you can have two more cans of that for free after you complain not what was advertised. So after stripping and re shooting this puppy twice I settled on plain old Kryon flat, practiced my spattering and got a technique for the finish coat I started the spray on adjacent cardboard getting it right and then moving over the cabinet. Then I baked it in a drying oven at 150 F for a couple hours and after colling overnight I started buffing with the paint thinner damp rag. Polished until I said there, that's about right. Put it together, sent pictures for approval and shipped it!
For me---I would have just taken to my friends with the powder coat facility, bead blasted and asked it go the next round of some satin black they do regularly. They also do the nice tight black wrinkle but not regularly and I don't want to pay the setup for one cabinet.
After that I went to Harbor and got a couple HVLP spray guns and said to wife "last time I use $()*&%^#@ spray cans"

Back to the original topic. My 2B dial in it's untouched original finish is definately more flat or mat than satin and more white than yellowed. That's why I would start flat and buff til it suits you. A lot easier to go dull to shiny than other way round.

My 2c worth YMMV

From: dlangl01
Topic: 11893 Message: 11893

I have a newly acquired TR-3 that is working excellent on all bands but 15m. I am new to old radios. When switching the band switch to 15 nothing works. Could it be a bad crystal?

Topic: 11894 Message: 11894

What is the best coax to use for the twins inter connect cables? r4a and t4xc. the low level cables, also the correct lengths.
thanks

Fernando,
You might not have been following the thread, but there was a problem, that prevented me from doing that. The transformer, in my AC-4, is not the standard one. It uses a set of different diameter and pitch machine screws, than the standoffs have. Then, the transformer is of a larger diameter, than the AC-4R is designed for. So it had to be done differently, and I am doing what others have done, when they had similar issues.
Would I rather have done it, the way it was designed? Sure! But, that wasn't an option

Dan

That government is best, which governs the least, because its people discipline themselves.

From: vacuuminded2@...
Topic: 11893 Message: 11896

Hi Dale,
If the calibrator can not even been heard, it's a good possibility the xtal has failed, assuming you have worked the bandswitch back and forth several times, and re-seated the crystal to be sure it's not just a contact oxidation issue. If you've tried transmitting on 15 as well, were you able to achieve any drive and a plate dip?
If you don't have another rock handy to try substituting with, you might try temporarily switching positions with one of the 10m or 20m one and see if you can get any sign of life in RX with the calibrator. Don't attempt to transmit when doing this.

Regards,
Chris kc9ieq

Garey:

>> I thought the 'real' TR-44(any) all had the T-4(any), NOT the T-4X(any)..??

Correct! Re-reading my post, I see it may have been misleading, though don't see where I said otherwise.

The first reference was to the recent e-auction of a T-4XC/R-4C combo in a CA-1 cabinet – definitely NOT a TR-44(C or any)! Though I quite often see ads listing a setup like that as such.

The TR-44B and the TR-44C have a Drake-printed nameplate on the side that _SAYS_ TR-44B or TR-44C. And their reciters, the T-4B and T-4C are labeled on the front as such. The Reciters in the "B" and the "C" TR-44's have a speaker that looks much like the RV-4 style speaker in place of the PTO/dial and the large xtal deck hatch on their sides.

I do not know if a "true" TR-44 exists as the only ones I have seen consist simply of a plain-jane T-4 Reciter and an R-4 or R-4A receiver in a CA-1 stacking cabinet – no speaker on the front, just plain empty front panel, and no TR-44 moniker. Drake may have sold some with those upgrades – just that _I've_ never seen one. Maybe someone could check an old Allied catalog from maybe 1967 or even earlier. That's where I first learned of the existence of the later TR-44B Comm station.

Drake sold one more Comm station of sorts in the '80's, probably aimed at the marine reserve market, with the R-4245 receiver and TR-4310 transceiver mounted together in a desktop rack cabinet. I've never seen that combo (have the sales brochure though) but I dearly love the TR-4310. I've paired mine with a "homebrew" R-4245 c/w transceive cable – I mounted a new R-4245 front panel on an RR-3, added the ANT switch and swapped the TR-7 knobs for Ratheons - couple of mostly unused buttons don't match up, otherwise looks great! It's tagged as a fake so in case I accidentally grab the HV in one of my amps some day, my wife and kids won't be accused of misrepresentation when they sell it! The TR-4310/R-4245 units were sold separately of course. I do not believe that the combo unit had a special moniker.

LOVE this thread! I have a special fascination for the Drake amateur rigs which morphed into into commercial units.

Wayne:

per your posted pics on the Yahoo site.....

As you suspect, you do not have a TR-44C, but the R-4C/T-4XC in a CA-1 stacking cabinet.

Still a nice setup! And you can work split!

From: k5fex
Topic: 11825 Message: 11899

I've wondered for a while if it was "real" HI.

Actually the Stack units are not in the shack.... to save space, i stacked the T-4XC and the R-4C I routinely use. The stacked pair gave me the idea. The shack picture shows the T-4XC, R-4C, TR-4C, MN2000, L4B, SPR-4 and C-4. Have some more pieces with no place to put them. Acquired a TC-2 and CC-1 for 2 meters that are boxed. The stacked unit thought to be the elusive TR-44C is actually at my office on a work table. Turn it on occasionly to keep the caps good. Have not tuned it up or used it since there isn't an antenna.

I'll look it over on Monday for the tags described. When purchased, the seller described it as a tR-44C that was originally put together for MARS use. However, when asking the knowledgable ones on this forum about the rig, I became a bit suspect. The crystals in the rig don't really match up with MARS freqs.

Anyway, time for meeting other hams in OKC for Saturday breakfast.

Thanks all for the info!

Dale -

All original cables were 38" long tip-to-tip.

The INJ, (and CAR OSC in the C-Line, cables used a foam inner dielectric and phono connectors with a
white insulation. This cable measures 60 pF total capacity.

All other cables used the standard for the day clear polyethelene inner dielectric and phenolic
(brown) insulated phono connectors and measure ~100 pF.

Original Drake INJ and CAR OSC Cables = 19 pF/ft = .160" o.d. (foam poly)

RG-62 = 93R = 13.5 pF/ft = 0.240" o.d.
RG-59 = 75R = 14.8 pF/ft = 0.242" o.d.
RG-6 = 75R = 16.2 pF/ft = 0.270" o.d.
RG-174= 50R = 30.8 pF/ft = 0.110" o.d.
Mic Cable (Belden 8410) = Hi-Z = 33 pf/ft = 0.160" o.d. (foam poly)
Mic Cable (Belden 8421) = Hi-Z = 16 pf/ft = 0.180" o.d. (foam poly)
R/S Audio Patch Cable = 28 pF/ft = 0.165" o.d. (poly)

The best choice is the Belden 8421 Audio cable from their "Brilliance" line. It looks just like the
other cables, and is very flexible. The RG-62 is OK, but it is 50% larger and far less flexible.
RG-62 is also prone to shorting if bent over too small a radius, and is susceptible to heat damage
when soldering connectors. The best "feature" of RG-62 is
that it is often FREE, since there have been many miles of it pulled out of old computer networks.
Belden 8421 is available by the foot from ACK Electronics in Atlanta. Other distributors have it as
well, although many require purchase of a full spool. N7IOH, another list member, had some at one
time that he was selling by the foot.

The only pertinent factor is the total capacity. Impedance and "loss" are not important.

Any _reasonably low capacity_ coax will work if the units are cabled together for the adjustment
of the INJ trimmers.

The cable type ONLY affects the LEVEL of the PreMix signal, (5.645 MHz ABOVE the transmit/receive
frequency,) and a small DC control voltage between the two. If the shunt capacity is too high,

insufficient LO level for the first mixer will reduce the sensitivity of the receiver and the output
power of the transmitter.

Some of the "commercial" cable mfrs use RG-59A, but it's a little larger and also prone to shorting
if bent over too tight a radius.

The ANT lead to the receiver is too short to matter, but you want good shield integrity, which
usually eliminates R/S cables.

The best connectors I've found are the Switchcraft 3502 plugs, available from just about anyone,
Digikey, Mouser, Allied, Newark and just about any reputable parts place.

Peter -

I wasn't contesting your post, merely making an observation! :-)

I remember theTR-44 as you describe it, with the T-4 'Reciter', (no speaker,) when it came out. We
couldn't think of anything other than mobile, (or portable?,) use, as in the MT-1 / MR-1 or HX-20/
HR-20 pairs from Heath. It shared a manual with the T-4X, both units on the cover, with second
chassis photos and schematic, both with big 'holes' in them! :-) We figured government was involved, and sure enough they went to SE Asia.

I can't remember if the TR-44 had the 'big' side panel, ('pockets' on the bottom edge to fit over
the tabs on the receiver bottom cover, and 'tabs' on the top to mate with the transmitter top
cover.) The receiver cabinet top had the transmitter bottom cover included, i.e., not two cabinets
welded together. The B and C were made that way.

Don't know much about the commercial gear, have my brain overloaded with 4-Line stuff! :-)

> The first reference was to the recent e-auction of a T-4XC/R-4C combo in a CA-1 cabinet – definitely NOT a TR-44(C or any)! Though I quite often see ads listing a setup like that as such.
>
> The TR-44B and the TR-44C have a Drake-printed nameplate on the side that _SAYS_ TR-44B or TR-44C. And their reciters, the T-4B and T-4C are labeled on the front as such. The Reciters in the “B” and the “C” TR-44’s have a speaker that looks much like the RV-4 style speaker in place of the PTO/dial and the large xtal deck hatch on their sides.
>
> I do not know if a “true” TR-44 exists as the only ones I have seen consist simply of a

plain-jane T-4 Reciter and an R-4 or R-4A receiver in a CA-1 stacking cabinet – no speaker on the front, just plain empty front panel, and no TR-44 moniker. Drake may have sold some with those upgrades – just that _I've_ never seen one. Maybe someone could check an old Allied catalog from maybe 1967 or even earlier. That's where I first learned of the existence of the later TR-44B Comm station.
>
> Drake sold one more Comm station of sorts in the '80's, probably aimed at the marine reserve market, with the R-4245 receiver and TR-4310 transceiver mounted together in a desktop rack cabinet. I've never seen that combo (have the sales brochure though) but I dearly love the TR-4310. I've paired mine with a "homebrew" R-4245 c/w transceive cable – I mounted a new R-4245 front panel on an RR-3, added the ANT switch and swapped the TR-7 knobs for Ratheons - couple of mostly unused buttons don't match up, otherwise looks great! It's tagged as a fake so in case I accidentally grab the HV in one of my amps some day, my wife and kids won't be accused of misrepresentation when they sell it! The TR-4310/R-4245 units were sold separately of course. I do not believe that the combo unit had a special moniker.

>>
>> The rig sold on the auction site is as described; CA-1 stacking cabinet containing a T-4XC and R-4C – it is not a TR-44C. Prices like that make it tough to hang to my similar set!
>>
>> However, there really is a TR-44C, like the much more common TR-44B, but with a T-4C reciter and R-4C receiver in a CA-1 stacking cabinet. The T-4C has an access door on the side for the TX crystal deck and a xtal switch on the front with many more positions than

the T-4XC. The xtals are not used to generate band ranges but actual tx frequencies, much as the VFO does in a T-4XC. A speaker takes the place of the tx VFO and dial. And it SAYS “TR-44C” on the label plate on the side. I know of only three of these seemingly rare Drake pieces – Sindre’s, mine, and another that W8DRZ owned for a while, but was sold some years ago. I am sure there are more out there somewhere. Maybe this thread will bring them out! There were clues with mine that suggested it was originally used as a communication station at an Austrian embassy in Cairo, Egypt.

Dale -

All original cables were 38" long tip-to-tip.

The INJ, (and CAR OSC in the C-Line, cables used a foam inner dielectric and phono connectors with a
white insulation. This cable measures 60 pF total capacity.

All other cables used the standard for the day clear polyethelene inner dielectric and phenolic
(brown) insulated phono connectors and measure ~100 pF.

Original Drake INJ and CAR OSC Cables = 19 pF/ft = .160" o.d. (foam poly)

RG-62 = 93R = 13.5 pF/ft = 0.240" o.d.
RG-59 = 75R = 14.8 pF/ft = 0.242" o.d.
RG-6 = 75R = 16.2 pF/ft = 0.270" o.d.
RG-174= 50R = 30.8 pF/ft = 0.110" o.d.
Mic Cable (Belden 8410) = Hi-Z = 33 pf/ft = 0.160" o.d. (foam poly)
Mic Cable (Belden 8421) = Hi-Z = 16 pf/ft = 0.180" o.d. (foam poly)
R/S Audio Patch Cable = 28 pF/ft = 0.165" o.d. (poly)

The best choice is the Belden 8421 Audio cable from their "Brilliance" line. It looks just like the
other cables, and is very flexible. The RG-62 is OK, but it is 50% larger and far less flexible.
RG-62 is also prone to shorting if bent over too small a radius, and is susceptible to heat damage
when soldering connectors. The best "feature" of RG-62 is
that it is often FREE, since there have been many miles of it pulled out of old computer networks.
Belden 8421 is available by the foot from ACK Electronics in Atlanta. Other distributors have it as
well, although many require purchase of a full spool. N7IOH, another list member, had some at one

time that he was selling by the foot.

The only pertinent factor is the total capacity. Impedance and "loss" are not important.

Any _reasonably low capacity_ coax will work if the units are cabled together for the adjustment
of the INJ trimmers.

The cable type ONLY affects the LEVEL of the PreMix signal, (5.645 MHz ABOVE the transmit/receive
frequency,) and a small DC control voltage between the two. If the shunt capacity is too high,
insufficient LO level for the first mixer will reduce the sensitivity of the receiver and the output
power of the transmitter.

Some of the "commercial" cable mfrs use RG-59A, but it's a little larger and also prone to shorting
if bent over too tight a radius.

The ANT lead to the receiver is too short to matter, but you want good shield integrity, which
usually eliminates R/S cables.

The best connectors I've found are the Switchcraft 3502 plugs, available from just about anyone,
Digikey, Mouser, Allied, Newark and just about any reputable parts place.

I used the RG-62 for my halli twins as that was specified in the manual , they work well and I got around the bending problems by using right angle shielded RCA plugs .
had to look for them and finally found some on the mouser site .
don't remember the part number though .

the local computer repair store gave my a large amount of it .

11909. Bringing my TR-4 back to life

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-09 20:52:51 UTC
From: Mark Pilant
Topic: 11909 Message: 11909

I've finally managed to spend some sorting through some of the more obvious issues with a TR-4 (S/N 29606) I picked up several months back.

Aside from needing a *serious* cleaning, there were three things I found before I could really start diagnosing things:

1) The T/R switch (S4) was shot. I looked around to see if I could transplant the slide and fingers from another switch, but I wasn't able to find a suitable donor. So I just drilled out the rivets and substituted another slide switch.

One thing I discovered was something had broken several of the windings on RFC11. Does anyone know of a suitable replacement? (Or have a replacement from a parts donor.)

2) The original (K1) relay was long gone, and the replacement was only about half connected. So I opted to get the TR-4 relay board from KE9PQ. I also ordered the appropriate relay from Allied, since I was also ordering some other things.

The instructions which came with the board, and I believe is the same instructions Drake used, don't mention adding a resistor in the plate circuit (of V19, VOX) which is mentioned in Garey's description.

This is further complicated by pin 9 of V19 is already in use as an intermediate connection between R114 and the coax to S2. So I'll probably need to find another way to include the resistor (since the relay coil is only rated at 48 VDC).

3) The #12 fuse lamp is also long gone. Even the socket is no longer there. Any suggestions as to a replacement? I'm thinking I might be able to find a bulb with characteristics similar to the #12 bulb, any *maybe* with wire leads. I'm open :-)

73

Oops. The relay board was from John (tr7dude) not KE9PQ. (I ordered the L-4B switch "stuff" from KE9PQ.)

Sorry for any confusion.

Did you try the crystal osc alignment Part C of the alignment instructions in the manual? You connect at VTVM set to DC- to the test point near V1. Then you adjust a coil based on the band. On a working band you should read a negative DC voltage. I suspect with a dead xtal you will read zero volts.

You could test this by looking at 40m (I assume 40m is working on your rig) and seeing what DC voltage you see at the test point. Then remove the 40m xtal and see what you read (of course power down the radio and let the caps discharge before sticking your fingers in there to remove the xtal).

11913. TR7 Receive Problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-09 22:19:05 UTC
From: kd8ejz
Topic: 11913 Message: 11913

Hi Group,

TR7 early serial number 1375 -No receive..

Powers up, receiver noise, calibrator signal heard, no change to noise when antenna connected, and no signals heard on any band, not even weak ones.
Everything else appears OK, VFO, display, and all other controls.

The TX/RX relay seems to operating OK and contacts look clean.

Any ideas what might be the problem?

No experoence on TR7's so hoping there might be a well knwn fix.

Thanks for all assistance!

Steve

11914. Where on the PBT reference board to check frequency output of 40 mhz,13.695 VX0

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-09 23:33:47 UTC
From: ka8asn
Topic: 11914 Message: 11914

For TR7 PBT/Reference Board
I have a guestion on where to obtain a test points to check the frequency of the 40 meter oscillator,the 13.695 VCXO adjustment and the 8.5 MHZ oscillator on the TR7 PBT reference board. The manual says use pin number 21 and adjust L1006 for max 40 MHZ output. For 13.695 MHZ adjustment the manual says use pin 17 and adjust L1005 for exactly 53.695 MHZ.For the 8.05 MHZ the manual says use pin 40 of the PBT board and adjust C1030 for exactly 5.645 MHZ. My question is this!
By not using the board extenders as the manual suggest where can I find the test points?

Thank you in advance

Any suggestions would be appreciated!

Is this a "new" (to you) TR-7? If is, check with an Ohm meter that you have a short between the center pins of the EXT ANT and EXT RCVR connectors on the back of the rig. There is an internal jumper there that is intended to be cut when the TR-7 is used with an R-7. An easy "fix" is to add an external RCA-RCA coax jumper on the back of the rig.

My first guess: A previous owner removed the internal jumper between the EXT RCVR and External Antenna jacks on the rear panel and you don't have a jumper between those two jacks. Connect one to the other with a short jumper and see what happens. You can hear the calibrator quite well with that jumper missing.

You don't need extenders - the pins are all accessible on the bottom side of the parent board. The last two rows near the rear have everything you need. Some of the points are labeled on the board near the pins. You never need the extenders for alignment, and it would be a bad idea to use them as some oscillators might shift a bit when removed from their shielded home.

Check the noise blanker board area. If someone "cherry picked" the noise blanker and didn't put the "switching board" in its place, it won't receive. I've not checked one to see if you could hear the calibrator or not, but if you've checked the jumper Jim and Floyd suggested, I'd look. It sure is an easy check.

Sounds as if this TR7 is a new one for you? If so, do you know anything about its history - when was it last working? Does it have any output when in transmit mode on CW with the carrier control turned up? There are some circuits that are used in both transmit and receive modes and that may tell you something. Are there filters installed? Are all the boards there? Check the noise blanker situation as someone else mentioned. I'd check to be sure the oscillators are running properly - you'll need a service manual for that. It's always a good idea with a new TR7 to pull each board and clean the pins they plug into with DeOxit or other cleaner. I use a Q-tip for that. You'll need to fashion a board puller out of a wire coat hanger in order to pull the boards. I see that Jim has a photo of one here: http://incolor.inetnebr.com/jshorney/tr7ext.htm .

Also, there are a few inter-board connections that are made with coaxial cable - I'd make sure all those are properly seated.

Mark -

Progress!

1. Don't forget there is very little clearance for screw heads when the cover is replaced! I show RFC11 as 750 uHy, 500 mA. It should be an 'air' core, not ferrite. It's there to keep
RF off of the RCVR MUTE connection. Same partas RFC2, 3, 4, 6, 7, 9 and 10, so shouldn't be too hard
to find a donor!

2. The resistor is NOT mentioned in those directions, which came from Drake. However, when the P&B
relay was used to replace the Varley in the later C-Line, because of the Varley's high failure rate,
the 1.5k resistor was added. Unfortunately, Drake already used Pin 9 of V19 for a tie pointin the
TR-4. Simplest is probably a resistor soldered to Pin 1 with the wire soldered to its other end,
with a little piece of shrink tubing over it for reinforcement. The shrink is probably overkill
unless you plan mobile operations.!

3. The #47 bulb is identical electrically, and could be installed with wire leads soldered to the
base. The bulb is there to protect against nearby operationof other high powered transmitters, such
as when you pull up to a stop next to an 18 wheeler running a couple kW on CB! If this is your only
radio, the bulb isn't necessary, but if you operateother transmitters while the TR-4 is still
connected to an antenna, the bulb could save T9's primary.

Hi Garey.

> I show RFC11 as 750 uHy, 500 mA. It should be an 'air' core, not ferrite.

Thank you for the specs. I'll see what I can dig up. It probably isn't real necessary at the moment as I'll be operating the TR-4 by itself.

I used pan-head screws for the switch, so there isn't too much head to worry about. I'll know for sure when I replace the cover :-)

> The resistor is NOT mentioned in those directions, which came from Drake.

It figures :-) I was thinking about doing what you mentioned: soldering a resistor to the socket and then soldering the wire to the "flying" end.

> The #47 bulb is identical electrically...

I had thought of that, I even have some #47 bulbs kicking around. I did manage to find some other bulbs (#2181 and #2112) which are 6.3 V but rated for 20 mA rather than 15 mA. These have wire leads. I also found a 12 V bulb rated for 8 mA, which might be more appropriate.

I have some multi-position antenna switches, so I'm probably safe. But I'll work out something when I get around to actually placing it into service. Right now, I'm just getting it together enough so I can start to really diagnose it.

BTW, for your amusement... Yesterday I got the new relay board installed and then got hung up with the instructions trying to figure out the numbered connections (from the instructions). It wasn't until after I sent an email to John, and checked the instructions again that I found the diagram. (As I slapped myself on the head :-) The interesting part is I stared right at the diagram because John had written the Newark part number for the relay right below the diagram. D'oh...

Thanks for your help/suggestions.

Topic: 11926 Message: 11926

I was given a sick TR-4 by a local ham that who thought that since I have 3 TR-4 and 4th one was called for. He was attempted to replace the RF gain, volume, power switch on the rig and he said it was receiving relatively well prior to his mishap. He thinks he reversed a wire or two in the course of installing the new switch. Once it was installed the receive is very weak. Tuning the calibrater on he signal move to 20 over S(as it should but the volume is still low even with the volume turned up to 3/4 of maximum. Output seems to be fair, but I think the finals need to be replaced. I am wondering if it might be a problem with something on the AF output board. Any suggestions are welcome.

Hello Floyd and all who have replied with ideas.

Thanks for the suggestions. I am trying to help an old timer Ham out ...apparently it was last working OK a couple of years ago and has been in the shelf since then.
Next step is to go back and check for all the boards, and clean the contacts and see where that takes .

I'll let you know how we get on.

Thanks all again!

Steve

Date: 2013-02-10 20:59:30 UTC
From: Mark Pilant
Topic: 11909 Message: 11928

Well, I have a little bit of progress.

After replacing the T/R switch and the relay I applied power. The short story is I don't get any audio from the speaker except a very low level AC hum.

On the plus side, with a 7.2 MHz AM modulated signal applied to the antenna connection, I do see a deflection on the S-meter. The down side is without the signal, the S-meter is at about 90% of full scale. (With a signal applied it goes to the extreme right side of the scale.) So it would seem I am at least getting a signal that far.

So the next step I have is to trace the signal from the antenna through the various stages of the rig. When I get bored with that, I can try signal injection to trace from the speaker back through the audio stages.

At any rate, the TR-4 doesn't seem to be completely dead; which is a plus.

Oh yes, Garey, the pan head screws I used to replace the rivets on the T/R slide switch do cause the bottom cover to stick out a bit, but with the top cover attached I just have to make sure I don't really "crank down" the cover screws at that corner of the chassis.

For Sale, 1 Electrovoice 729SRD with the Drake "D" emblem and Drake plug. It's in good shape, the base has some small paint chips and the mic is in pretty good condition. Will send pics if needed.

$40.00 plus $10.00 shipping. Prefer PayPal, will take Postal Money Order.

Mark -

Time to recheck the relay wiring!

First level check.... Note the RCVR CATH bus. Confirm that all points on this bus are at ground
reference with power off and disconnected.

With power on, in receive, touch a screwdriver to the wiper (middle) terminal of the AF GAIN
control, and then touch the blade of the screwdriver with your finger. (Effectively touching the
middle terminal with your finger). Should be a loud buzz from the speaker.

Turn RF GAIN control fully clockwise. S-Meter should read near 0. Turn fully counter clockwise,
and S-Meter should read near full scale.

Hello List,

I just thought I would get back to you all, that I ordered a 'Red Noogie' and installed it in my 2B today. It looks and works great. I also ordered a Crystal Calibrator to replace the Heathkit xtal calibrator that I had 'stuffed' in the space in the back of the 2B. It worked but didn't fit well as it was too wide and tall. The old 2B is still a great receiver!

73 guys,

Ski

Anyone on this list going to the Birmingham hamfest the first week in March?

If so, AND you happen to have an AC-4 PSU and/or a RV-4 VFO, W-4 watt meter, or MN-4 ATU you want to off-load, let's get together.

Hi
Us old F**ts still have the original Drake Handle which came with the TR7.
I just use one end if the board has only one lifting hole.
I guess the original handles will be collectors items soon.
Its sad the original owners didn't pass them on with the rigs, but I guess its understandable
if the radio came from an Estate Sale.

Subject: [DrakeRadio] TR7 - a useful alignment procedure change

I was working on a special project involving the TR7 Up Converter board and stumbled across something I thought I'd pass along to TR7 owners who work on their own transceivers.

The Up Converter board is buried under the shield beneath the digital readout board and is used on both transmit and receive. I have two boards, one marked 1977 and the other marked 1979. The older board has just two grounding fingers (on the connector edge), while the newer board has a total of 6 grounding fingers along with a very different ground plane on the board.

The Service Manual alignment process has you peak capacitor C418 (on the Up Converter board) for maximum S meter reading of the calibrator signal. I found that on the older board, the peak setting for C418 was different on transmit and receive and while the peak was rather broad on receive, it was much sharper on transmit. After peaking C418 on transmit, I found that I had 20 watts more output on 10 meters than when the the cap was peaked on receive.

So, the next time you run through the alignment, try peaking the cap on transmit instead of receive, particularly if you're unhappy with the maximum power you can achieve on 10 meters. C418 is accessed via a hole in the digital readout board, so is fairly easy to get to.

There's no easy way to tell which version of the Up Converter board you have without taking it out, but on the cards I have, the newer one has no insulation over the signal coax shield while the older card uses the grey covered coax. It also appears that the coax on the new card is a bit larger in diameter than the older card.

From: Dan Galligan
Topic: 11943 Message: 11943

I am moving all of my boatanchors, as well as a load of household goods, to my new home in eastern OK, this coming week, including my Gold Dust Twins. I am pretty well full-up, for the trip east. But, I will have an otherwise empty trailer, coming back to SoCal, the following week.
Does anyone need their heavy, delicate rig, moved, with personal attention, to proper care, that United Parcel Smashers, or other carriers will not give, to your precious gear?
I will be bringing an otherwise empty, 12'Lx6'Wx6'H enclosed cargo trailer, behind my Chevy Tahoe, and would be happy to help someone out, if they help me pay for some of my gas, to come back. No firm price, it depends upon size, weight, and difficulty to move it.
I can pick up, anywhere along the I44/40 corridors, from Joplin or Ft Smith, west, and deliver to anywhere between there and Los Angeles County/SoCal area.
I have no set price, as it will depend on how much work it is to secure it, how much it weighs, and how far it needs to be moved. But, I will be very fair, in my pricing. I can even move smaller stuff, in my car, for less money, too.
If you are in need of moving something that you are buying or selling, and would like it done by someone who understands the desire to preserve your precious equipment, please send me an email. We will work out a very fair deal.
Listmates, will get extra consideration, in price.

Just FYI, use a padded envelope, lest your screws will be swallowed up in some machine at the Postal Service. I made the mistake a few years back, of mailing an switch button, for a TS-940SAT, to AF6NI, and wound up having to buy another, as when the flat #10 envelope went through the machines, it tore a hole in the envelope, and was lost forever. The padded envelope costs a bit more, and costs more to mail, but it alerts the USPS to the fact that something NOT FLAT is in the envelope, and it gets handled differently.

All at ground. Well, OK, .4 ohms :-)

> With power on, in receive, touch a screwdriver to the wiper (middle)
> terminal of the AF GAIN... Should be a loud buzz from the speaker.

Hum is louder today than yesterday, and no change in sound when I
touch the wiper (pin 7 of V18 if I read the schematic correctly).

> Turn RF GAIN control fully clockwise. S-Meter should read near 0.

Fully clockwise, S-meter reads about 80% of full scale.

> Turn fully counter clockwise, and S-Meter should read near full
> scale.

Fully counter/anti-clockwise, and the S-meter is off the scale. It
is pegged to the right of the meter.

When I have some more time available, start working from each end.
RF from the one end and AF from the other.

From: Mark Brueggemann
Topic: 11954 Message: 11954

I don't typically work on boatanchors but when I do, invariably the wafer switch contacts and wipers are black with oxidation.

Is there a prevailing technique for cleaning these up? I'm just wondering if there's something better than spraying with contact cleaner and working the switch until the wiper wears a clean groove in the contacts.

Hi Mark,

Others dispute the technique, but I've very successfully "rubbed" the contacts clean here with little more than a good eraser-end of a lead pencil...

Just be careful to blow away any residual rubber, and do not disturb any of the fixed contacts by hitting them hard with the eraser.

It works very well, & the oxidation comes off with a minimum of effort...

I spray a bit of contact cleaner in a cup and then soak Q type tips in the
cleaner to scrub the contacts as I work the switch
The longer wooden handle Q tips reach difficult places
Don't soak the switch with cleaner if you can avoid it.
Works well for me

Mark -

I have an opinion... [SURPRISE!!]

The black or dark brown 'grunge' on silver is silver sulfide. It forms by combining silver with
sulfur compounds in theair, and the rate of growth depends upon air quality. It's softand easily
scraped off by the wiping action of rotary switch wafers, in fact many toggle switches and relays
are also designed with 'wiping' contacts for this reason.

Some advocate cleaning this grunge off with 'silver cleaner', making the switch look like new.
There are several reasons for NOT doing this. One, and perhaps most important, poking around wafer
switches with tools, scrubbing components, is the best way I know of to destroy a switch. All it
takes is a Q-tip to hang on a fixed contact, or some other mishap to 'spring' a fixed contact.
Switches the size of those in 4 Line receivers and transmitters do NOT lend themselves to
replacement of a single contact. Bigger switches make it possible to replace individual contacts
from donor switches, but not the tiny ones we use. Two, silver cleaners work in one of two ways.
Either they have chemicals that dissolve the silver sulfide and allow it to be wiped off, or a mild
abrasive that scrubs it off. Note that the word 'silver' appears here. What this means is that any
type of silver cleaner works by removing SILVER sulfide. The remaining 'cleaner' must also be
removed completely, as most are corrosive. For Grandma's solid silver gravy ladle, this lossof
silver is negligible. The silver PLATING on switch contacts is not very thick, and if you 'remove'
enough, you end up with brass contacts. This leads us to three, silver sulfide is self limiting,
i.e., once the base silver is covered, it stops forming. So when you remove the silver sulfide,
exposing the nice bright silver, the silver sulfide immediately starts forming again. Grandma's
Sterling silver gets pretty grungy from one Christmas to the next Thanksgiving.

A little DeoxIT, a gentle exercising of the switch to dig out that nice, bright strip of silver,
then a little more DeoxIT to protect it from sulfur, works just fine, and the rest of the

contactremains safely covered by silver sulfide.

So... If you want 'pretty' switches to look at (?), silver cleaner is your weapon of choice. If you
want your radio to work for years without further attention to switch continuity, stick with DeoxIT.

I am a little confused about Deoxit. It seems there are two flavors and each has a slightly different purpose and people use both versions. One is a cleaner and the other is something I forget at the moment. I've looked at their website but need a user explanation.

What are the two different kinds and in what sequence should be applied to switch contacts? Should they both be used or is that overkill.

Would appreciate any advice. Bob, NZ5A

I've used a brand new dollar bill and slid it between the contacts and slide back and forth. This has worked on all but the worst oxidized switches.

Hi Mark,

Others dispute the technique, but I've very successfully "rubbed" the contacts clean here with little more than a good eraser-end of a lead pencil...

Just be careful to blow away any residual rubber, and do not disturb any of the fixed contacts by hitting them hard with the eraser.

It works very well, & the oxidation comes off with a minimum of effort...

THANK-YOU!

I was surprised no one mentioned using DeoxIT until Garey! I use D100 for all my switch cleaning and it also protects and coats the contacts as well. I get the little spray can that meters each 'shot', so wastage and object saturation is a thing of the past!

I've heard that DeoxIT can be absorbed by phenolic and, in the case of high-impedance circuits, that can be problematic. I don't know if that applies to the switches under discussion but it is something to think about.

It is supposedly best to apply it precisely and only where needed. While I've never had one, the needle applicator looks like it would work the best on wafer switches.

I went through this lesson last year, when I did my first two (ever) radio resurrections. One was an R4-C. I tried most of the mentioned methods, and have since come to the conclusion that DeOxIT D100L, with the needle applicator, is the preferred product, for switch contacts. It takes very little, so a small bottle, will last a very long time. Also, I have on hand, DeOxIT Gold, for plugs and tube pins, and DeOxIT Fader Lube, for variable resistors, and such. Since those first two radios, I have done a few more, and been much happier with the results of the DeOxIT products, available from Amazon.com.
I hope this information helps.

So that I understand completely, just general spraying of the wafer switch with DeOxit is not a good idea. It is better to use small doses applied directly to the contact.

This said, my process of spraying, working the switch through its settings, then using compressed air to blow out any remaining liquid from the spray left on the wafer is probably not such a good idea? Thoughts on this? Even with this process I still have the "grunge" on the contact parts of the wafer switches.

Spraying a chemical on a fiber wafer is VERY BAD! Contacts only please. (If you do it on ceramic, you can at least wipe most of it off). Not only will the wet fiber conduct, but it will also swell in size). Believe me, you do not want to spray the whole wafer.

I think it is a matter of what the switch is used for. Low impedance, low frequency circuits are much less likely to be affected by it.

Absolutely correct. use small amounts directly on the switch contacts, individually.

This said, my process of spraying, working the switch through its settings, then using compressed air to blow out any remaining liquid from the spray left on the wafer is probably not such a good idea? Thoughts on this? Even with this process I still have the "grunge" on the contact parts of the wafer switches.

Using compressed air to "blow it out" simply blows it to another place in the radio, and Lord only knows, if it might be detrimental, to the parts where it winds up. There are contact cleaners, without lubricant, which will evaporate, rather rapidly, but again, they do nothing to protect the switch from further. DeOxIT, with the needle applicator, is the best option, for wafer switches, in my opinion. You can use the 5% or the 100%. Either works well, but the 100% is my preference. And, again, the Fader Lube product from Caig, is the best for variable resistors. And, Caig's DeOxIT Gold, is wonderful for protecting the contact surfaces of metal contacts in plugs and plug receptacles.

Wayne -

Correct. General spraying is not a good idea. I have seen a few phenolic wafers that swelled up
enough from 'an unknown cleaner' to misalign the contacts.

The 'other' problem with spraying is that most DeoxIT products leave a small protectant behind.
This material on 'everything' serves only to collect dust, which is between HV carrying contacts can
carbonize and develop leakage paths.

I prefer D100L in the needle applicator bottle for major cleaning, applied directly to each fixed
contact and exercised through the switch action. This results in the 'thin silver line'. I then
apply a few drops of Gold, which is a little heavier protectant, for good measure. By the way, as
someone else suggested, the 'FaderLube' spray product works wonders on carbon pots.

That thinsilver line is the contact point, and the rest is protected by a nice, black coat of silver
sulfide! :-)

Hi Mark,

Others dispute the technique, but I've very successfully "rubbed" the contacts clean here with little more than a good eraser-end of a lead pencil...

Just be careful to blow away any residual rubber, and do not disturb any of the fixed contacts by hitting them hard with the eraser.

It works very well, & the oxidation comes off with a minimum of effort...

Hi Bob,

I'd send you one of our Canadian "Loonie" dollar coins to do the job for you, but I'm afraid its thickness would distort all of your contact wafers...! :o)

Wayne -

Correct. General spraying is not a good idea. I have seen a few phenolic wafers that swelled up
enough from 'an unknown cleaner' to misalign the contacts.

The 'other' problem with spraying is that most DeoxIT products leave a small protectant behind.
This material on 'everything' serves only to collect dust, which is between HV carrying contacts can
carbonize and develop leakage paths.

I prefer D100L in the needle applicator bottle for major cleaning, applied directly to each fixed
contact and exercised through the switch action. This results in the 'thin silver line'. I then
apply a few drops of Gold, which is a little heavier protectant, for good measure. By the way, as
someone else suggested, the 'FaderLube' spray product works wonders on carbon pots.

That thinsilver line is the contact point, and the rest is protected by a nice, black coat of silver
sulfide! :-)

From: w7jpg
Topic: 11954 Message: 11974

Hey Joe,
Is the spray can you're using marked with "metered spray"? Or? How recently did you buy it?

The last can I purchased, several years ago, has a typical looking aerosol valve with three settings printed on the top of the can (rotate the spray head to choose L - M - H). I now spray into a small bottle (and use swabs) and stopped spraying into the target because there was too much spray (I thought). It didn't seem to make any difference which setting I used in terms of the amount of material dispensed.
Thanks,
Chris

Believe it or not....that trick of using a dollar bill actually does work for burnishing conductive surfaces. We use to use them to clean up the crypto card readers in the crypto vault. It would be more than a little tricky to try that with a wafer switch!!

Vic -

Mouser has new carbon composition resistors. Just like the old days, except they're about 50 cents
each for 1/4 or 1/2W. One Watt versions are a couple dollars! If you need higher power, the Ohmite
OX and OY series of _ceramic composition_ resistors are 1 and 2 W sizes, also from Mouser.

Vic
Metal oxide, ceramic, carbon film are non inductive.
Metal oxide used in RF dummy loads in the uhf range
Best choice depends on the particular applicatin
For rf power like grid resistors in linears, parasitic suppressors etc I
prefer the Ohmite ceramic composition type.
Carbon comp resistors are like buggy whips, few people use them anymore but
they are available in limited values from Mouser

From: Ian Reeve
Topic: 11978 Message: 11986

Hi Vic,

Ah right, I think it unlikely I have any of 5watt rating but I will take a look and let you know.
One of our Club members (Wythall Radio Club) Barry M0DGQ has done a repair on a Yaesu Fl2100B linear, replacing both the grid stopper resistors and the anode parasitic resistors.
For the grid stoppers he used hi-stab resistors, presumably carbon film and for the anode resistors in parallel with the inductors, he used 2 x 56 ohm in parallel to get to the original value or very close to it.

Is the grid or anode resistors you need to replace?

Ian

Subject: RE: [DrakeRadio] carbon resistors

Hello Ian

Thank you for reply. I need to build new parasitic stoppers for my linear so guess the wattage would be 5w.

Cheers

Vic

Careful. Some metal oxide resistors _are_ spiral cut and have a very small amount of inductance like their carbon film cousins.
I've used the non-inductive HPC/PCF series ceramic composition resistors made by KOA Speer before, (very high quality, made in Japan), the working voltage ratings are a little iffy for use in a plate supply though. Not familiar with the Ohmite series, will check them out.

Regards,
Chris

Hi Vic,

I have a couple of 33 ohm resistors, made by Phier 2 watt rating. They measure 24mm x 8.8mm so are fairly chunky but are non-inductive. I tested for inductance on my meter and they both measure 0.000uH so they should be ok as long as they are not physically too big.
If they are might find some smaller 1 watt ones if I dig deep enough.
Their DC rating should be sufficient as they were designed for chunky valve circuitry.

Let me know

OK. You'll need the Ohmite OX or OY, I can never recall which is which, 1 or 2 Watts. Physically
they are about the 1/2 and 1W size of the carbon comps. Check the dimensions in the Mouser data
sheet if size is important.

some time ago I got a Boonton 250 RX meter. This is a combination of a signal generator, bridge and detector covering frequencies up to about 250 mhz. and intended to measure very low Q devices. I looked at a variety of resistors including modern film resistors. Up to at least 10kohms I did not measure any significant reactance. I should get the thing off the shelf again and make further tests. Unfortunately it is quite heavy and I am limited in lifting.
The instruction book shows an example of a carbon film resistor along with a carbon composition resistor, the film resistor has _less_ reactance leading me to think my measurements were valid.

12000. Grungy amp tank coils (slightly OT)

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-14 06:03:17 UTC
From: w7jpg
Topic: 12000 Message: 12000

Reading Garey's explanation on the properties of silver sulfide in the "Grungy Wafer Switches" topic caused me to wonder about the Grunge that is on the coils in my B&W 850 tank coil assembly. I presume it is also silver sulfide.

My question is: (yep you guessed it!) Is the Grunge on the tank coil also harmless to the operation of said tank coil assy at 4 KVDC and a bunch of RF amps? I've read several "dissertations" by hams that claim this Grunge must be removed (by polishing) in order for the coils to function properly in the High DC Voltage - high RF current environment.

Anyone?

TIA
73,
Chris

Chris -

The basic question here is regarding 'skin effect' at RF. This just says that the higher the
frequency, the less RF current penetrates to the center of theconductor. At UHF and up the RF
current only goes a few thousandths of an inch 'deep' into the conductor. In this case, silver
plating helps efficiency because silver has a lower resistance than copper, and most of the RF is
going through the silver. At HF, silver plating isn't all that helpful. Solid silver would help,
but a thinplating has no real effect. It IS pretty though!

Unfortunately, silver 'tarnishes'. The two most likely forms of tarnish are silver sulfide, the
brown/black stuff, and silver oxide, the whitish stuff that you get on your hands when you open a
new rotary switch from Centralabthat was wrapped in sulfur free paper!! Most of you aren't old
enough to have experienced that! :-) I digress..... Anyway, silver sulfide is soft, and not a very
good conductor. Silver oxide is hard, and just about as good a conductor as silver itself.
Unfortunately there is enough sulfur in today's atmosphere thatsilver sulfide is far and away more
common. Again, at HF silver sulfide isn't that big a deal, since it's a poor conductor, and the RF
current flows deeper in the conductor anyway. Sort of like using insulated wire.

So if you want a pretty silver tank coil, you need to coat it with DeoxIT or lacquer, or something
to protect it from the sulfur in the air. Again, if you attack it with either abrasive or solvent
silver 'cleaner', you'll be removing whatever silver has combinedwith the sulfur (it's 'silver
sulfide', remember) and so the plating gets microscopically thinner each time you polish it.

Garey and all,

The advantage of a silver plated copper coil over an unplated coil (at least in the past before silver sulfide became a problem) is that silver oxide is a good conductor while copper oxide is not. Because the current density decreases exponentially with increasing depth, plating a copper coil with silver allowed the conductivity to remain high on the outside of the coil where the density is the highest. A more cost-efficient approach today would be to take a clean copper coil and coat it with enamel to prevent oxidation or corrosion.

73,

Bob AD3K

12006. Precision AM Detector

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-14 18:11:04 UTC
From: Paul Christensen
Topic: 12006 Message: 12006

After acquiring a Drake SW-4 and 4A, I wanted to experiment with a low-distortion AM detector, but not go through the hassle of using an outboard synchronous detector. In reviewing on-line literature, K2CU has developed an interesting low-distortion, full-wave circuit that seems ideal for use in these older receivers where the I.F. is 455 kHz and lower.

I took K2CU's schematic and converted it into a PCB:

http://tinyurl.com/adpl4a8

There are a few changes, mostly in power rail conditioning, polarity protection, grounding options, and the addition of an optional voltage regulator. A 'lytic cap is added after the input supply resistor for power supply decoupling.

In some receivers where the AGC sense is post detector, it may be better to keep the existing square-law diode detector but route the audio from the new detector to the AF stage. In the SW-4 series that isn't an issue. And, in the case of the SW-4A, it's going to get the same Class AB PP audio board as used in my 4B and 4C receivers.

I'm about ready to order a prototype of the PCB and may make a few boards available although I am not getting myself into an order fulfillment business. I'll likely order between 10-20 boards and make them available at my exact cost per board + shipping.

I'll have more info on my QRZ.com page when the boards have been fully tested and ready.

it seems to be just a small amount it sounds to the other station
to be a bit high in frequency a few hundred hertz or so.
not so far off as to be unreadable but off.
the previous owner used it for cw only it that makes a diffrence.

Fred,
The first thing that comes to mind is that you are actually tuning in the other station off frequency, possibly do to a miss-adjusted carrier oscillator or a bad sideband filter. Have the other station go to the opposite sideband and listen to you there, just a thought.

Garey can probably help better than I, but I recall there is a small relay that pulls the BFO off frequency for CW operation. If those contacts are stuck, or dirty (can't remember which), you'll be off by around 500 Hz. Might be worth a look?

Steve -

Interesting thought! Actually that relay shifts the CO about 900 kHz, which would really mess
things up. However..... If the relay contacts are just grungy ... The relay is K2, back in the
left rear corner, mounted on the rear chassis wall. The N.C. contacts are for SSB, so cleaning those
couldn't hurt.

Gary came to the same thought, i.e., CO off frequency, but I'm not sure that would cause it......
Nothing changes in the CO when switching from XMIT to RCVE. IF the CO is off slightly one way, and
the 'other' sideband filter is being used (due to the mixing scheme) it would be off twice as much
through the other filter. This is why I asked 'how far' it was off. Might make it easier to figure out.

Terry,
If you don’t locate an original transformer try Hammond. I believe the 6AQ5 is around 10k to 15k ohms impedance. I have used non Drake after market transformers in the past with excellent results.

I like to use tube testers for relative transconductance values to match balanced parallel tubes. Substitution can work if you are not balancing tubes.

Terry -

For most things, you're far better off with a tube to substitute. If the tube has actually been
previously used in that position, and worked, it's a 'known good spare' and the best choice.

Tube testers are primarily good if you have a big box of tubes to sort as good/bad.

There are two major types of tester. Most of the old Hickok, TV-7, etc. are 'Mutual Conductance'
testers. These actually set up the tube with a known bias, apply a small signal, and measure the
gain, i.e., a 'real' functional test. There are still a couple of caveats though. One, this is
typically run at 60 Hz, and has only minimal relationshipto operation at RF; and two, the test is
run at only one operating point, again chances are this is different from the in-circuit point. The
other type is merely an emission tester. Here the filament is heated, the various grids are tied to
the Cathode or Plate as appropriate, and the total current is displayed on a "BAD-?-GOOD" scale.
This is solely a test of the Cathodes ability to produce electrons, which is what 'wears out' in a tube.

So unless you have a huge inventory of tubes to check, or equipment with a hundred different tube
types, a set of 'known-good' tubes for each piece of equipment is your best bet. When you get your
new tubes, pick a rainy day and substitute them, one-at-a-time, into the gear they are intended
for. If the unit operates as well as, or nearlyas well as with the original tube, remove the
substitute, replace the original and go on to the next tube. If the substitution results in poor or
no operation, try another potential sub. If neither sub works, are you sure you have the right
sub!?!?! :-) If so, consider the circuit and whether changing a tube 'should' make that big a
difference, and require alignment. I can tell you from experience, there are VERY few instances
where that is the case.

Matching tubes, such as PA tubes in the Drake transmitters, can be done in the transmitter by
installing them one at a time,with a fixed BIAS setting, and measuringthe voltage across the Cathode
resistorto determine the IDLE current of each tube.

So overall, the money invested in a tester would probably be better spent on a few more spares.
Tubes ain't getting any cheaper!

IMO tube testers can be very useful provided you know
what they are testing. Some testers check only for emission
so will not detect many tube problems; they are to be
avoided. Better testers test the amplification of the tube
and indicate the mutual conductance and some testers will
also test for gas in the tube. Nearly all seem to test for
shorts between pins. Mutual conductance is a fairly good
test for the condition of a tube and can be used to match
tubes. The gas test will often indicate why some tubes that
otherwise test good don't work in the circuit.
The military TV-7 series is a very good tester although
not as convenient as some others because it requires
resetting the switches to test both sides of dual tubes.
There are several versions of it but the letter code mostly
indicates the manufacturer. Lots of literature on them on
the web.
Evidently Hickok more or less invented the modern tube
tester and made some very good ones. I don't know which
type the Heathkit one is or if they made more than one type.

Very cool old tester! We had one in shop I worked at during High School. Set up mistakes were none existant and very fast to go from one tube type to another.
If nothing else it should be somewhat of a priceless relic to ebay market
Or, find suitable card stock and replicate the most needed cards, clean it up and use it. Hickok made some very good tube testers

Thanks Garey !

This is pretty much what I thought but needed to hear that for sure. I see some "deals" but as others have suggested, those are probably not in very good functional shape and unless you can test emission and conductance it probably makes low cost testers not very useful. By I really don't have enough tubes to test so we'll just refine the substitution method a bit more. the way, thanks for the other Reflector Members who responded including Evan, Ron, Fred, Charles, and Paul .that input is valuable and appreciated.

Garey,
Actually I think its 5000 ohms for a single ended amplifier and 4 ohm speaker. So much for my memory, HI HI. I used a multiple tap transformer I had on hand at the time. It worked great.

73, gary

Years ago I repaired CB and some other tube radios for extra money and found the tube tester was of very little use. There were often only a few differant tubes used in the sets. As I usually kept one or more of each in stock, it was just as easy to subistute the tubes, often lots quicker. After about a year and almost no use of the tester, I sold it.

Sometimes the CBers would want me to change out all the tubes in their sets, so I did. There was nothing wrong with them,but when they pay, I do what they want. Then I marked the tubes as used and often popped them in a set to see if it was the tube. If it was, I then got a new tube and put it in. As this was just a hobby side business, if I knew the people and they did not have much money, I would put an old tube in for nothing if they wanted me to.

Most low power tubes seldom go bad for many years unless broken or the filiment burns out. Most tube checkers will not test the high power tubes. Say 50 watts or over, maybe not even that high.

If you have to pay $ 50 or $ 100 for the tester, yo would be beter off buying some extra tubes.

Picked up my TV-10 D/U at the Framingham (Mass.) Hamfest in 1985, IIRC, for the princely sum of $25. The price tag is still on it This tester has served me well and, while certainly not a substitute for swapping tubes in a situation where you're looking for better performance, it certainly does its job for screening out weak, gassy and shorted tubes.

Yeah, I know I could get 15 - 20x my purchase price today. Not parting with it.

BTW, if you acquire one of these military testers, there is a webpage that gives you all the data from the rollchart, plus some additional tubes that weren't on that chart.

This was compiled by Nolan Lee, who has been an SK for quite a while but whose tube tester data lives on!

Thanks Garey !

This is pretty much what I thought but needed to hear that for sure. I see some "deals" but as others have suggested, those are probably not in very good functional shape and unless you can test emission and conductance it probably makes low cost testers not very useful. By I really don't have enough tubes to test so we'll just refine the substitution method a bit more. the way, thanks for the other Reflector Members who responded including Evan, Ron, Fred, Charles, and Paul .that input is valuable and appreciated.

Terry -

For most things, you're far better off with a tube to substitute. If the tube has actually been
previously used in that position, and worked, it's a 'known good spare' and the best choice.

Tube testers are primarily good if you have a big box of tubes to sort as good/bad.

There are two major types of tester. Most of the old Hickok, TV-7, etc. are 'Mutual Conductance'
testers. These actually set up the tube with a known bias, apply a small signal, and measure the
gain, i.e., a 'real' functional test. There are still a couple of caveats though. One, this is
typically run at 60 Hz, and has only minimal relationshipto operation at RF; and two, the test is
run at only one operating point, again chances are this is different from the in-circuit point. The
other type is merely an emission tester. Here the filament is heated, the various grids are tied to
the Cathode or Plate as appropriate, and the total current is displayed on a "BAD-?-GOOD" scale.
This is solely a test of the Cathodes ability to produce electrons, which is what 'wears out' in a tube.

So unless you have a huge inventory of tubes to check, or equipment with a hundred different tube
types, a set of 'known-good' tubes for each piece of equipment is your best bet. When you get your
new tubes, pick a rainy day and substitute them, one-at-a-time, into the gear they are intended
for. If the unit operates as well as, or nearlyas well as with the original tube, remove the
substitute, replace the original and go on to the next tube. If the substitution results in poor or
no operation, try another potential sub. If neither sub works, are you sure you have the right
sub!?!?! :-) If so, consider the circuit and whether changing a tube 'should' make that big a
difference, and require alignment. I can tell you from experience, there are VERY few instances
where that is the case.

Matching tubes, such as PA tubes in the Drake transmitters, can be done in the transmitter by
installing them one at a time,with a fixed BIAS setting, and measuringthe voltage across the Cathode
resistorto determine the IDLE current of each tube.

So overall, the money invested in a tester would probably be better spent on a few more spares.
Tubes ain't getting any cheaper!

Hi all.

I have a TR-4CW and RV-4C and now I'd like to connect both to a digital frequency counter DIRAC.

Is it correct to connect to a pin2 of J2 in TR-4 or same pin in RV-4C?

Can you give some light?

Thanks and 73.

I agree with Steve in that tube testers are useful. I have a very good one. While tube substitution is the best method for evaluating tube performance in a circuit, my tester can tell me with accuracy which tubes are clearly bad. When you have a pile of 'em, that's useful. Also when you have good ones, you can compare one to the other. Bob, NZ5A

Lee also shows adapters to fit compactron tubes in a
TV-7. I built an adapter to test the finals in the T4B.
Works like a charm and makes it easy to match tubes. An
advantage of the military testers is that there is often
update information on tubes built after the original chart
or book.

Steve -

Ihave a TV-7D/U that I picked up for about the same price as yours. This one was just back from
Tobyhanna, with a fresh calibration sticker on it. It hasn't been turned on in five years. I used
it once when I bought a box of tubes of unknown condition, and for that it was great.

I had a second one someone gave me, and it had a bad power transformer in it. Sold it for parts for
$350!

Subbing just works better, faster, and unless you have 50 different tube types in your gear, cheaper
too! :-) Plus when you NEED a spare, you have one!!

12035. TR7 Transmitt ISSue

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-16 13:46:27 UTC
From: Joe
Topic: 12035 Message: 12035

My TR7 has suddenly stopped transmitting I can key the mike but it does not pass any audio. I get virtually no meter deflection. I tried my Keyer as well with no transmit. I don't want to take my golden screwdriver to it without having some clue as to where to start looking. My first thought would be the the antenna change over relay. I can hear it engage but perhaps it is not fully engaging? Anyone have some pointers or suggestions?
Joe N9JCQ

12036. Drake 4 Series Makeover

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-16 15:52:39 UTC
From: daveincaol
Topic: 12036 Message: 12036

I've been 'appointed' to sell on items of equipment left behind by GM3XIJ (RIP). Amongst the rigs are 5 pieces of Series 4 system. The 'covered' items appear in good condition although I haven't opened them to check. The ones known to have some internal corrosion on the copper plating are the vented Rx and Tx. Fortunately the corrosion in these is restricted to the upward facing horizontal surfaces, the vertical and under surfaces are bright and new looking.

Because these items are for selling on my intention is to refurbish only the outer covers and apply a bit of silver polish to the sockets if necessary.

My quandary is how to treat those copper surfaces where rust has broken through. The worst area has 90% rust and the least perhaps 30-40%.
My thoughts are to clean back with a stiff nylon brush. Vacuum any debris and then apply a rust neutraliser.
If at a later date an owner wished to restore to display standard then would this method cause them least trouble getting the metal replated? If there is a better alternative please let me know.

I don't know if the equipment works as yet. I have made arrangements to take it to the nearest active club who will test it. If it is serviceable I don't think it would be very sensible to do much more than modest restoration. What do you think?

From: Jim Shorney
Topic: 12035 Message: 12037

The first step in troubleshooting any sudden 7-line failure is to re-seat all of the plug-in circuit boards (don't forget the boards under the DR-7). The Molex connectors get dirty/oxidized over time, and cause all sorts of interesting problems. Cleaning the connectors and/or sparing application of DeOxit is not a bad idea at this point. While you are in there, make sure all of the grounding fingers are making good contact, and the screws on the shield covers should be snug (but not over-tight, they are easy to strip).

Of course, the relay is a good point to check as well, but they seem to be pretty reliable.

There's a lot of good TR-7 info on wb4hfn.com, if you haven't been there yet.

From: Ian Reeve
Topic: 12036 Message: 12039

Please don't use silver polish, it will do more harm than good. A little (really small spray)of deoxit and manipulation will get the contact surfaces as good as new.

As for the copper, leave as is in my opinion. The issue of corrosion is well known and any prospective purchaser would I am sure have their own methods and would rather know it had not been cleaned and buy "as is"

From: Steve Wedge
Topic: 12036 Message: 12041

I'll second the opinion of avoiding silver polish. If you can get deoxit or Cramolin (I think this is still available in EU), apply very sparingly to rotary switch contacts.

If you want to put forth the effort, you can remove as much corrosion as possible using stiff Nylon and sealing with varnish or poly to arrest further corrosion. However, if you are trying to move them quickly, clean up the cabinets and front panels/knobs, test to ensure they're working and sell them. You'll get more if they're working.

Lee also shows adapters to fit compactron tubes in a
TV-7. I built an adapter to test the finals in the T4B.
Works like a charm and makes it easy to match tubes. An
advantage of the military testers is that there is often
update information on tubes built after the original chart
or book.

From: Bill Jackson
Topic: 12045 Message: 12045

I have for sale an original instruction manual for the Drake model 34-NB Noise Blanker Kit. This manual appears complete and in excellent condition. It came in a box of miscellaneous items that I purchased from an estate sale and is excess to my needs.

I will consider a best offer over $5.60, which is the cost to ship this manual via US Priority Mail Flat Rate.

Please contact me off list at k9rz@... if you are interested.

Garey, et al, I sent copies of both Nolan Lee's
spreadsheet and the DJN material to Steve. I accidentally
sent it to the list, which of course, stripped off the
attachments. I no longer remember where I got the material.
Some may have come from BAMA and some from EB5AVG site.
Both sets of information have instructions for making
adapters for both nine- and twelve- pin compactrons. The
adapters are easy to make but its a convenience if you can
get ready-made ones. There were actually adapters supplied
for the TV-7 but they are quite rare.
Nolan Lee's spread sheet also has a page for converting
the arbitrary readings on the TV-7 meter to Gm. The
settings in the two documents are not quite the same, I
chose to use the set that gave Gm readings closest to the
published values.

Garey--

I just made a temporary 19k 2.5 watt resistor from 5 20k resistors I had
and inserted it. Measures 10.4 volts where the collector should connect.
Soldered the collector and turned the RV-4C on. Like magic it works!
So now I will order a permanent resistor. I think you fixed another one.
Thanks for the help.

12050. Drake R-4A, R-4B, or T-4X plastic dial scale

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-17 04:37:26 UTC
From: Al
Topic: 12050 Message: 12050

I'm in the process of refurbing an R-4A, and I discoverd that it has a warped dial scale, which scrapes the copper chassis in front of it at some positions. I was wondering if anyone has a dial scale that is flat and would like to sell it, or if anyone knows how to successfully flatten a plastic dial.
I saw some posts about it from 2011, but I don't know if anyone has really had success with that sort of thing. I thought about clamping it between a couple pieces of wood and baking it. Any thoughts? I don't want to destroy it, but I'll give it a try if it has a good chance of working.

Thanks and 73,
Al, WA2S

12051. Re: [DrakeRadio] Drake R-4A, R-4B, or T-4X plastic dial scale

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: Bernie
Topic: 12050 Message: 12051

Remove the plastic part so it is just the plastic part only...sandwich it between 2 clean pieces of glass...clamp the glasses together using clothes pins all around...set in the sun for a couple hours and then cool it down gradually...unclamp the glass and it should be flat. We were doing a live broadcast one summer from a recreation dock (back in the days when radio played real records on site (45's) and since it was 96 degrees, the spinning records would warp under the sun even before they were completely played. When we returned to the station...it was my job to try to "flatten them" again...and that's the method I used on 2 dozen records....I still have two of them in my collection and they're still flat...

Attempt the following at your own risk.......
I once flattened the warped plastic (assuming lexan or a similar acrylic not unlike the Drake dials?) pointer on a Sprague TO-4 Tel-ohmike I rebuilt. -A carefully used hair dryer may be worth a try too- but I VERY cautiously used the microwave, just a few seconds at a time until the plastic became warm enough to hold a flex. I then very quickly sandwiched it between the countertop and a flat, heavy object. After allowing several minutes to sit and cool, it was found to have held its flattening "treatment".
I consider myself lucky that it worked this time, I suspect it would take very little time to burn, or flat out melt it instead of just softening in the microwave. Figured I had nothing to lose, as a replacement for that pointer would be easy to make from a sheet of 1/8" lexan.

If you have an oven that will regulate down to just over 100 degrees, you might give that a shot with the dial sandwiched between two flat (glass would be nice) objects. It would take some time, but going up just a few degrees at a time might land you at the *perfect* temp to soften it amply without going over and hurting, or destroying it.

Just a couple ideas if you can't find a replacement, again proceed at your own risk... YMMV

Regards,
Chris

12053. Power output T-4XB

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-17 10:45:24 UTC
From: sm7dlk
Topic: 12053 Message: 12053

My final tubes are probably a bit down, have only abt 75-80 watt out. But this does not concern me since I only need abt. 25 watt to drive my PA. So before looking into a possible replacement of the final tubes I can accept the lower output.

But it is the following that I need to have explained.

Say I have 75 watt in TUNE with the Gain set to abt 12 a clock. But in CW and with GAIN in the same position and with key down I have only abt 15 watt. To get 75 watt I have to turn GAIN fully clockwise. It varies between bands. On 80 is almost OK but on 40 and higher I have to turn GAIN fully to get more or less the same output.

OK. The manual state the following: "Due to different operating condition between TUNE and CW, the power output may be lower in the CW position for a given setting of the GAIN control.

I probably have to do a complete check-up but before I do, what is that "different operating condition" stated in the manual that causes this huge difference between power output in TUNE and CW?

I thought that the dial may be warped on the R-4A I have. It now appears that the knob shaft has a lot of movement. The shaft is not supported at the outer end and relies for rigidity on the inner bearing.
I have some ideas for fixing it but would appreciate comment.

Goran -

This is normal. It sounds like your PA tubes are pretty tired. Ensure that both arestill working.

The TUNE signal and CW signal are generated by entirely different methods.

TUNE converts the MIC amp to a ~ 1kHz audio oscillator (also used for SIDETONE). This single tone
is applied to the Balanced Modulator to generate a single tone SSB signal. Think whistling into the
microphone. The transmit ALC is also active, which is why (with decent PA tubes) the output goes up
rapidly to about 130W and 'levels out' even with further increased GAIN adjustment. This is the ALC
taking control.

CW shifts the Carrier oscillator ~ 900 Hz up into the LSB filter passband. The Balanced Modulator
is unbalanced by a DC current, controlled by a second section of the GAIN control, that is applied
to the diode ring. This allows the CO signal togo on through the BM with minimal attenuation, and
it is then applied to the Mixer and on through the rest of the transmit chain, just like an SSB
signal. There is no ALC applied, which is why you can often get more power output in CW than in
TUNE. Again, with GOOD PA tubes.!

The extreme difference you are seeing is probably an artifact of the lack of PA gain. There WILL be
more output available on CW, as explained above, and since the GAIN control has two isolated
sections there is no realrelationship between the modes. Some transmitters require more GAIN on CW
than others, especially on the higher bands, but most reachnominal output by 1 - 2 o'clock setting
of the GAIN control. TUNE will 'flatten out' SSB at about 10 - 11 o'clock.

Dave -

Sounds like the rear support adjustment has been loosened too much. There is an Allen setscrew that
supports the rear of the threaded lead screw. As it is tightened, it applies pressure to the front
bearing. It should be just tight enough to eliminate side play in the MAIN TUNING knob.

I believe in the "A" you'll have to remove the PTO can to get to the adjustment. GENTLY compress
the clips on either side to allow removal of the can. Looking inside from the back, you'll see the
set screw in the center. FYI, you should have ten (10) balls in the front bearing support, and one
(1) ball under the rear setscrew. Hopefully yours isn't so loose as to lose any bearings. Be careful
not to disturb any wiring or components inside the PTO can. SOME can be quite critical and affect
linearity.

12057. To Be (2B) Continued

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-17 19:28:22 UTC
From: Mark Brueggemann
Topic: 12057 Message: 12057

I ordered some Caig D100 and Fader Lube for my grungy contacts and controls. I have some other projects I can use it on so it wasn't hard to justify. Thanks everyone for the input on that topic.

Now, another facet of my 2B resurrection is some of the wiring is burned up. At some point it was powered up with one of the dial lamps floating around and it shorted to ground, toasting some of the 6.3V supply wires.

Now, I *could* just use any old wire of sufficient size and replace the various pieces. But like many folks on this list, I'd like to at least make an attempt at having it look as well as work right.

I need some 22ga (.025") solid copper wire, 300V (.060" OD) PVC white wire. For about $30 I can buy a 100' spool of this stuff brand new but there has *got* to be someone here that has some just laying in a pile out in the garage or whatever. Can anyone spare about 3' of the stuff? Happy to pay postage and all that. I must have 40 spools of wire in my garage and it's all stranded. I checked with the home stores and Radio Shack and no one has 22ga.

My replacement caps came from 2BRadioParts the other day so we're off to a good start.

Hello folks:

We are moving to a new and smaller QTH, so I'm trying to downsize a bit to facilitate the move. A while back, I became very interested in restoring some boatanchor gear, so I bought a nice EICO 666 tube tester and had accumulated a bunch of tubes (mostly, NOS) while enjoying this activity.

I would like to offer what I currently have in stock (at a reasonable price) to those who might be interested. Shown below are the items that I currently have.
I'm willing to sell the whole lot or individual components, but I don't have a good deal of time to devote to this activity.

First come ☐ first (reasonable offer) served + USPS shipping (Paypal OK).

2 ☐ Servicemaster NOS 6GE5 tubes (matched set) ☐ will NOT fit in the Drake T4X cage.

1 ☐ 6883B (12 volt 6146B) - NOS
1 ☐ 6SC7 ☐ NOS
1 ☐ 6H6 ☐ NOS
1 ☐ 6K6GT ☐ NOS
1 ☐ 6SG7 GT ☐ NOS
1 ☐ 5Y3WGTB ☐ NOS
1 ☐ 6SA7 ☐ NOS
1 ☐ 6BH6 - NOS
2 ☐ 6EA8 ☐ Test OK
1 ☐ 6AH6 ☐ NOS
1 ☐ 6GY6 / 6GX6 ☐ Test OK
2 ☐ 6DC6 ☐ Test OK
3 ☐ JAN 5750 (6BE6) ☐ Test OK
2 ☐ 6BA6 ☐ Test OK
2 ☐ 12BE6 ☐ Test OK ☐ Unboxed
1 ☐ 12BA6 ☐ Test OK ☐ Unboxed
1 ☐ 5U4GB ☐ Test OK - Unboxed

Goran, this sounds normal: Every transmitter I've owned needs the GAIN advanced for the same output in CW mode. When in the TUNE position, the rig is actually transmitting a sine wave through the audio circuit, so there's some gain there.

75W out does suggest the finals are getting tired, but make sure your levels in to the finals are as they should be. There have been some discussions about resistor values drifting, which can affect the operation of the final.

Also, if the problem has recently surfaced - especially after removing/replacing the light bulb holder/blue filter assembly, be sure it's not actually dragging on the filter material.The filter layers should be behind the metal piece.

I've had a dial scrape only to find that I'd put it back together wrong.

Date: 2013-02-18 01:32:15 UTC
From: Mark Pilant
Topic: 11909 Message: 12065

With some help and encouragement from Garey, I have found and corrected a number of problems with the TR-4. In my last post to the list, I said it appeared the rig wasn't completely dead, and was responding to a signal.

And now the story continues...

The "problem" with the S-meter was a simple one... I just didn't zero it. After zeroing the S-meter, it seems to be behaving correctly.

I double checked all the power supply voltages and they were fine. A bit higher because the line voltage at our house can sometimes push 130 VAC. (We are right off the pole transformer, not down the line.)

Since I was having strange audio problems, at Garey's suggestion I checked the voltages at all the tube pins. While most were OK (within [arbitrary] 10% of the values in the table), some were really out.

Before I went too much further, I decided to give all the tube sockets a shot of Deoxit. I had planned to do this before I did the voltage check, but forgot in my enthusiasm :-)

After the tube socket cleaning, I decided to start another voltage check. But, before I did, by a fortunate circumstance, I was just exercising the mode switch and when I switched to the X-CW position, I heard the side tone from the speaker.

Instead of doing the voltage check, which I will still do, I opted to hook up my antenna and see what I could hear on 40m SSB. WOW, as I tuned the dial I started hearing hams on the air, and the volume control really worked.

All in all, a number of strange things appeared to have been "cured" by cleaning the tube sockets and tube pins.

More in the next message...

From: Mark Pilant
Topic: 11909 Message: 12066

Continuing on...

Some more things I have uncovered as I try to bring this rig back
to the land of the living...

The PO had installed a relay, of unknown function, with one of the
coil wires going to the key jack, and the other wires just dangling.
This relay is now gone.

A PO had disconnected the J3 relay pins (5 and 8) from the feed-thru
caps going to the (K1) relay. I need to put these back. Especially
since I have ripped out the relay the PO had hacked into place and
put in the proper Drake relay board and relay.

I also was having problems with the 100 KC calibration oscillator
not working. One problem was the pins of the socket were real
loose and some were just barely making contact. So after replacing
the socket with another of the same type (from my junk box :-) the
calibration oscillator is now working. When I set the mode switch
to CAL and hold my scope probe near the plate connection of V5, I
see a signal with the appropriate (10 uS) period.

Now to where I need some help... that's next

From: Mark Pilant
Topic: 11909 Message: 12067

As I was checking through various things, undoing the relay added by the PO, I noticed there is an original Drake wire just hanging in space.

If anyone happens to have the bottom of their TR-4 off, I'd really appreciate a set of remote eyes to try and see where this wire goes.

The unconnected wire is white with a gray stripe, and is part of a three wire "bundle" which goes between the VOX pot and the chassis. The other two wires, white with brown stripe and white with black strip, go to the PHONES jack. Given the length of the white/gray wire, I suspect it may go to the MIC jack, but I'd like to be sure.

I've tried tracking the wire back to it's source, but it disappears in a larger bundle, and I really don't want to undo it if I can avoid it.

After fixing the problem I know about at the moment, I'll do a voltage check just to get a new baseline. If everything looks reasonably OK, I'll go through the alignment procedures.

Mark,

I have an orignal Drake wire on my Version 3 TR-4 - white with grey stripe - running from MIC jack TIP to R108 3.3M on Board 4. It runs with two others that terminate at the phone jack - white with black and white with brown, as you describe. Hope this might help.

Mark -

That is the PTT line. The relay was probably some sort of foot switch or other external control

12070. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-18 12:45:56 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 12070

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

Thanks to all who have responded to my question re restoring Drake 4 chassis. Points taken and being evaluted.
There's mention in a 'sticky' that TR7 problems largely relate to switches, contacts etc. I've also noted that both Deoxit and Cranolin cleaners have been suggested. The price difference is substantial. I know that we get what we pay for (or at least hope to) but is Deoxit worth 4 times as much? Or is Cranolin basically an alcohol solvent mostly good for degeasing.
I ask because there is a TR7 and PS7 in the equipment I've arranged to be tested in three weeks or so and these haven't been used for perhaps ten years.
Regards
Dave

12072. TR4 troubles

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-18 15:01:50 UTC
From: tjb813
Topic: 12072 Message: 12072

With some guidance from a knowledgable fellow on this list (GArey) I was able to locate the source of the relay "hanging". It was an open diode.

Now that is solved, but there is a newer problem that has now surfaced.

When transmitting I get feedback from the speaker, the receiver acts like it its still active and the receive AGC peggs out. When I un-key, it takes several seconds for the receiver to un-wind. I assume the REC-KEY circuit is still grounded (or shorted to ground via a tube or bypass cap). Plauseable?

Other ideas?

Garey,

Thanks a lot for your feedback and explanation, I really appreciate it. Question mark has been straightened. I now understand how the TUNE signal and CW signal are generated by the different methods

This specific T-4XB I have owned since 1972 when I bought it new. It's been resting from time to time but is since 2-3 years in daily use. I did a quick check and found the premixer (V8) weak. Changed the tube and did a light "tune-up". Now exceed 100 watts on all bands. I think I am on the second set of 6JB6A tube on this TX.

73,Thanks
Goran SM7DLK

Goran -

Great! I 'assumed' since you mentioned the weaktubes that youhad been through the others as well.
Gets me in a lot of trouble! :-)

A touch-up of the alignment is also useful. The compression type trimmer caps are prone to shift
with heat/cool cycles and/or any vibration, especially on the higher bands. I touch them with a
drop of fingernail polish, which seems to help considerably.

The 6JB6's are a LOT tougher than people think, as long as you don't do something stupid. The very
'feature' that made them a popular choice back then, i.e., high plate current with low plate
voltages, makes them VERY easy to overload by being off-resonance. IF you make every effort to keep
the final dipped, and don't spend 15 minutes trying to tune up into the wrong (or NO) antenna, they
will last as long as the popular 'transmitting' tubes.

Topic: 12072 Message: 12082

Well, that was a dumb answer! It was right for the twins though.... :-)

There is a RCVR CATH line in the schematic, which grounds multiple points to enable receive.
Obviously those points must be ungrounded to mute the receiver. Tubes involved are V3B, V7, V11 &
V12. A heater-cathode short in any of these tubes could be the problem. Also Pin 5 of the RV-4C
socket under the chassis.

Another possibility is that the two fixed contacts of the relay are too close together,enabling BOTH
the XMTR and RCVR lines at the same time.

You HAVE done Section L. of the alignment, (Neutralization of the IF), right?

So you think the grounded cath-key circuit is plauseable? I have to assume its a low impedance path, not a short. Leaky caps have done worse things.

THe relay was replaced with some kind of kit by the previous owner. Relay looks ok, but I tried a different one anyway. No JOy.

The easy path would be to swap V3,7, 11, 12 one at a time with working TR4. If that doesn't locate the problem , then time to start looking for a leaky bypass cap.

Well, I have a place to start now. The fun is in looking for the problem, the joy in finding it!

From: Garey Barrell
Topic: 12072 Message: 12084

Have you checked the relay wiring?? The Receive / Transmit function is controlled by a single SPDT
pole of the relay. The 'arm' is grounded, and in Receive (unenergized) the Normally Closed (top)
contact is grounded and grounds the RCVR CATH line. In Transmit, (energized,) the Normally Open
(bottom) contact is grounded, keying the XMTR CATH line. It really does need almost a dead short.

The bypass caps on these lines are disc ceramics, which are not prone to shorting. Possible, but
not likely.

Have you checked the IF Neutralization??

Which diode was blown??

Matt, Garey, thank you for the eyes :-)

The PTT line makes sense, as one of the lines to the "extra" relay was where the PTT line was supposed to go. I just finished soldering the PTT line back to where it was supposed to be.

I just have a couple of more connections to figure out/undo (related to the VOX relay contacts [5 and 8] of J3), and then all the wiring should be back to normal. Then, maybe, I can hook it up to my signal generator and dummy load and try to actually to an alignment.

Regarding Deoxit, be aware there is another contact cleaner called
De-Ox-Id, with a spray can similar in style to Deoxit. It appears
to be "made" by GC Electronics.

I don't know how it compares, but I thought folks should be know
about it to avoid possible confusion.

Mark -

Cool.

Pins 5 and 8 go only to a set of Normally Open relay contacts. There is no Normally Closed contact
function. The original relay HAD no upper contact!

Hi Garey.

> Pins 5 and 8 go only to a set of Normally Open relay contacts.

Yep. It appears as though pins 5 and 8 on J3 have had some "work".
One of them now has no connection, and the other is going to take
a bit of manipulation to figure out what, if anything, is connected.
(It is sort of buried under some disc caps.)

I know there was work because of the stubs of cut off wires, and
the tell-tale signs of soldering... melted insulation :-)

Garey, I also want to thank you for all the work you did on the
CDs. Having high resolution pictures I could really zoom in on
made some of my task a great deal easier.

12090. Re: [DrakeRadio] Bringing my TR-4 back to life... PO modifications undone

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-18 22:07:38 UTC
From: Mark Pilant
Topic: 11909 Message: 12090

Well it looks as though I have undone the last (I hope) of the PO modifications. It turns out the last one was fairly easy to undo.

As part of the other modifications, the PO had cut the wire going to J3-5, thus disabling the VOX relay. While the wire had been cut just about at the bundle, there was enough left (after taking the wire out of the bundle) to re-attach to J3-5.

Not really a modification, but it appears sometime along the way, the MIC jack was replaced with a jack for a standard 1/4" plug. While not real high on my list, I'm going to try and see if I can get a suitable replacement back to the original size.

Now to start planning the alignment :-)

Thank you for all the help.

I use Deoxit made by Caig Labs Inc.
There certainly is another product which can be googled De Ox Id or DE-OX-ID which is a different product from a different manufacturer.

Both seem to be on sale from Amazon amongst others, but deoxit is top dollar IMHO

Hi Wayne,
Welcome to the Group.

I am the proud user of a Drake R4-C which is superb, one corner of the case took a slight battering during its travels from the seller to myself but it is barely noticeable.
Mine is totally original and the only issue is wear to some of the more used RCA jacks on the rear apron, namely the speaker connection

Always a dilema, do you keep as totally original or do you restore or indeed modify.

There are plenty of mods out there to address issues especially with power supply modifications.

I do hope you can find a suitable Drake to enjoy.

It is difficult to know if there are other products which are as good as deoxit but less expensive. I would guess there are a lot of near equivalents ou there but personally I find deoxit is by far the best against Servisol and RS contact spray.

I find you only need such a small "squiry" of deoxit so it does go a long way!

Subject: [DrakeRadio] Re: Drake 4 Series Makeover

Thanks to all who have responded to my question re restoring Drake 4 chassis. Points taken and being evaluted.

There's mention in a 'sticky' that TR7 problems largely relate to switches, contacts etc. I've also noted that both Deoxit and Cranolin cleaners have been suggested. The price difference is substantial. I know that we get what we pay for (or at least hope to) but is Deoxit worth 4 times as much? Or is Cranolin basically an alcohol solvent mostly good for degeasing.

I ask because there is a TR7 and PS7 in the equipment I've arranged to be tested in three weeks or so and these haven't been used for perhaps ten years.

Regards

Dave

The T-4Xcame out with the R-4, or very shortly thereafter. I had one of the first R-4ssold, ordered
before it was 'announced', and I received it almost a month before the T-4X. Obviously they were
designed together. The T-4X came with an AC-3, as the AC-4 was not yet even announced.

The interconnection with the T-4X was described in the T-4X manual! Ya really didn't need it unless
you had a T-4X now, did ya?!? The T-4X manual also showed interconnection with the 2-B, and a
'Linear Amplifier' including an external T-R relay.

Wayne -

Welcome to the group. Here is a little description of the various Drake 4 Series receivers I posted
on the list some time ago. There ARE differences, and you really need at least one of each to form
your own opinion!!! :-)

Feel free to post any questions orcomments to the list.

The 2-B is an outstanding CW receiver, the dial calibration is a little coarse by today's standards,
but for just getting on the air and enjoying a CW QSO it works as well as any. It has three (L-C)
filter bandwidths, (500, 2100 and 3600 Hz,) built in along with passband tuning. The 100 kHz
crystal calibrator was optional. The companion 2-BQ Q Multiplier adds a very sharp peaking filter
and a nice tunable null, both at the IF.

There is no matching transmitter for the 2-B.

The R-4 is almost a 2-B, just with a linear PTO and 1 kHz dial calibration. All tubes. Very similar in operation, and will transceive with the matching T-4X for an excellent CW station.
Fourfilter bandwidths, (400, 1200, 2400 and 4800 Hz,) passband tuning, noise blanker, LC notch and
100 kHz crystal calibrator built in.

The R-4A (early 13 tube model) is an improved R-4, almost identical specifications. PTO and Band
Oscillators converted to solid state.

The R-4A (late 11 tube model) almost identical specifications. Product detector, BFO, AGC and low
level audio stages converted to solid state.

The R-4B (early) is very similar to the late R-4A, minor modifications and crystal calibrator
multivibrator for 25 kHz markers. Several ergonomic
improvements, painted lettering above belt line, tilted knob skirt, PTO in use light.

The R-4B (late) almost identical except PTO changed from bipolar to FET.

The R-4C (early) very similar, except IF filters changed to crystal filters. Only the 2.3 kHz
filter is standard, 250, 500, 1800, 4000 and 6000 Hz BW are available as options. The 4000

& 6000
Hz filters are normally installed in a special socket under the chassis and is effective on AM
only. Four position filter switch. The noise blanker was optional. Entire audio chain solid state, tubes used only from RF to IF, all other stages and oscillators solid state.

The R-4C (late) same. Five position filter switch.

The 2-B through the R-4B used L-C filters in the IF. This type of filter has much gentler slopes,
which means that nearby signals are still heard, just at reduced levels. The crystal filters are
steep sided, more like the crystal filters in today's receivers. Personally, I prefer the L-C
filters for all except heavy duty contest use. I like to hear what is going on around my frequency,
instead of "listening with blinders on"...

The T-4 series transmitters are all pretty much the same, the T-4X had 4 pole crystal filters while
the T-4XB and C had 8 pole filters. The later ones therefore had slightly better carrier and
unwanted sideband suppression, neither of which has ANY effect on CW operation. ANY 4 series
receiver will transceive with ANY 4 series transmitter, mix and match. There are minor things like
the B line had a neon indicator light under the dial to show which PTO was controlling in transceive
while the C line just turned the dial lamps on or off. The R-4 and R-4A had neither, so you had to
look at the switch!

My opinion..... The R-4B is probably the best receiver overall. It has great audio, smooth AGC,
all the filters and noise blanker are built in. The L-C filters are not quite as "drop off the
table" selective, but I prefer that for casual QSOs.

The R-4C has poorer audio, a little harsher, the "better" (?) crystal filters are extra, and the
noise blanker is extra.

The R-4 and R-4A are just earlier iterations of the R-4B, and are not quite as refined, although
some say they prefer the early R-4A to the R-4B because the tube type product detector in the R-4A
is "cleaner".

The 2-B isn't very far behind, except it will NOT transceive with anything, and the dial calibration
is not precisely linear.

Yeah, you'll just have a couple of jacks left over on the T-4XC, PTO LAMP and CAR OSC, neither are
supported by theR-4A or B. You'll want a shorted plug in the PTO LAMP to keep the dial lamp on all
the time, otherwise it will only be on in SEPARATE and XMTR Control.

Hi Garey:
Thank you very much for this fine detailed explanation, I am glad that you took the time to expain the differences, I knew that the R4 line of drake receivers were very good but did not know their differences and which one would be right for me, but I am leaning towards the R4B based on all of my research it seems that other drake owners like that model the best.
Thank you very much.

Terrell -

I"ve never owned an SPR-4, but the block diagram is essentially identical to the R-4A/B, just
implemented in solid state. The Passband Tuner looks to be just like the 2-C, i.e., no moveable
passband, just four fixed bandwidths.

Thanks for all the info.

I don't have any pieces of glass on hand, but I do have some small pieces of wood that are very flat and smooth, and about an inch thick. I was thinking of clamping the plastic dial scale between those and putting in an oven for a couple hours. I think I can get it to stay around 125 degrees. I don't know if that would be too hot or not. Any thoughts?

thanks,
Al

I don't know if you are still interested on an R-4A at all, but I I have a nice one that has been all refurbished and aligned within the last year. The front panel is close to perfect and the cabinet is very nice, with very few noticeable scratches or blemishes. It does have some of the usual spotting on top of the copper chassis, but less than average in my opinion.
It works great on all bands, with no issues. I wasn't planning to sell it quite this soon, but if I get a good offer, I will certainly think about it.

I am helping to dispose of some amateur radio equipment for an estate located in Atlanta, GA.
If you have an interest in any of this equipment let me know and I will provide you with more
details. I have not had time to check any of it out and can send some pictures of it. I would
recommend you go to www.rigpix.com to get some detailed information one each.

I will not have it picked up or checked out prior to upcoming Dalton Hamfest and will not be
bring any of it to that hamfest. Some of the smaller items can be shipped but I would prefer
pickup either at my home or at the home of the widow who lives in the Buckhead area of Atlanta.

Unless the wood is very, very smooth, I would be concerned about transferring grain patterns to the softened plastic. It might not do that, but if it did, it would be pretty hard to undo.

Subject: [DrakeRadio] Re: New Member and a drake Receiver R4, R4A, B, C.

I don't know if you are still interested on an R-4A at all, but I I have a nice one that has been all refurbished and aligned within the last year. The front panel is close to perfect and the cabinet is very nice, with very few noticeable scratches or blemishes. It does have some of the usual spotting on top of the copper chassis, but less than average in my opinion.
It works great on all bands, with no issues. I wasn't planning to sell it quite this soon, but if I get a good offer, I will certainly think about it.

73,
Al, WA2S

Garey -

Wasn't the reduction drive for the PRESELECTOR also a difference between the R-4 and all subsequent versions?

Wayne -

Welcome to the group. Here is a little description of the various Drake 4 Series receivers I posted
on the list some time ago. There ARE differences, and you really need at least one of each to form
your own opinion!!! :-)

Feel free to post any questions orcomments to the list.

The 2-B is an outstanding CW receiver, the dial calibration is a little coarse by today's standards,
but for just getting on the air and enjoying a CW QSO it works as well as any. It has three (L-C)
filter bandwidths, (500, 2100 and 3600 Hz,) built in along with passband tuning. The 100 kHz
crystal calibrator was optional. The companion 2-BQ Q Multiplier adds a very sharp peaking filter
and a nice tunable null, both at the IF.

There is no matching transmitter for the 2-B.

The R-4 is almost a 2-B, just with a linear PTO and 1 kHz dial calibration. All tubes. Very similar in operation, and will transceive with the matching T-4X for an excellent CW station.
Fourfilter bandwidths, (400, 1200, 2400 and 4800 Hz,) passband tuning, noise blanker, LC notch and
100 kHz crystal calibrator built in.

The R-4A (early 13 tube model) is an improved R-4, almost identical specifications. PTO and Band
Oscillators converted to solid state.

The R-4A (late 11 tube model) almost identical specifications. Product detector, BFO, AGC and low
level audio stages converted to solid state.

The R-4B (early) is very similar to the late R-4A, minor modifications and crystal calibrator
multivibrator for 25 kHz markers. Several ergonomic
improvements, painted lettering above belt line, tilted knob skirt, PTO in use light.

The R-4B (late) almost identical except PTO changed from bipolar to FET.

The R-4C (early) very similar, except IF filters changed to crystal filters. Only the 2.3 kHz
filter is standard, 250, 500, 1800, 4000 and 6000 Hz BW are available as options. The 4000 & 6000
Hz filters are normally installed in a special socket under the chassis and is effective on AM
only. Four position filter switch. The noise blanker was optional. Entire audio chain solid state, tubes used only from RF to IF, all other stages and oscillators solid state.

The R-4C (late) same. Five position filter switch.

The 2-B through the R-4B used L-C filters in the IF. This type of filter has much gentler slopes,
which means that nearby signals are still heard, just at reduced levels. The crystal filters are
steep sided, more like the crystal filters in today's receivers. Personally, I prefer the L-C
filters for all except heavy duty contest use. I like to hear what is going on around my frequency,
instead of "listening with blinders on"...

The T-4 series transmitters are all pretty much the same, the T-4X had 4 pole crystal filters while
the T-4XB and C had 8 pole filters. The later ones therefore had slightly better carrier and
unwanted sideband suppression, neither of which has ANY effect on CW operation. ANY 4 series
receiver will transceive with ANY 4 series transmitter, mix and match. There are minor things like
the B line had a neon indicator light under the dial to show which PTO was controlling in transceive
while the C line just turned the dial lamps on or off. The R-4 and R-4A had neither, so you had to
look at the switch!

My opinion..... The R-4B is probably the best receiver overall. It has great audio, smooth AGC,
all the filters and noise blanker are built in. The L-C filters are not quite as "drop off the
table" selective, but I prefer that for casual QSOs.

The R-4C has poorer audio, a little harsher, the "better" (?) crystal filters are extra, and the
noise blanker is extra.

The R-4 and R-4A are just earlier iterations of the R-4B, and are not quite as refined, although
some say they prefer the early R-4A to the R-4B because the tube type product detector in the R-4A
is "cleaner".

The 2-B isn't very far behind, except it will NOT transceive with anything, and the dial calibration
is not precisely linear.

12116. FOR SALE.....2 - DRAKE WH-7 WATTMETERS Real Nice!!

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-19 15:56:12 UTC
From: Robert Ross
Topic: 12116 Message: 12116

Hi Guys:

I have FOR SALE..... TWO (2), DRAKE WH-7 Wattmeters. They are described below. Both of them are Real Nice and I would grade them a 9 out of 10, and Real Clean.....Non Smoking Home.

Both have been used by me with a Pair of Drake TR-7's, and they work Fine. They still have the Original Drake Tags attached showing Serial Number and Date of Manufacture. These are both the NICE PAINT Version...NOT the Sticky Paint Model. No Damage and have been looked after!!!

3 Power levels 20/200/2000 Watts and VSWR

These are Nice Units.....

They are Described Below.

PRICES are in USA DOLLARS and PAYABLE by USPS Int'l Money Order (The Pink Coloured One), or Personal Check Only.

SORRY NO PAYPAL
****

Please email me directly at..... va3sw@... to reserve either of these Units.

POSTAGE is EXTRA. Shipping ONLY to NORTH AMERICA.
****

73...ROB VA3SW

Robert S. Ross

12117. New Member into and Q's

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-20 06:53:06 UTC
From: zl1bbw
Topic: 12117 Message: 12117

ZL1BBW was ZL1DAB prior to that G3YCP.

Two drake sets R4B T4XB MS4 & R4C T4XC MS4 MN4.

Just getting back on the air after a long period of inactivity, so using the standbi rig a TS530.

Revamping the linear/s both of them are 2x 4-400 in GG will be installing the W7RY qsk boards into them and giving them a general overhaul.

Two problems with the Drake twins.....

T4XB turned it on and a quiet psst from the back left hand corner, still got standing bias and sidetone, but no drive, before I dive in there any standard problems to look for?

R4C... the crystal calibrator does not work, get a speaker click when I turn to cal but no cal signal anywhere, any standard problems on the board is it just a case of checking it through?

Thanks Gavin

12118. Re: TR4 troubles ; Resolved!

It was V11, a 12BA6. Couldn't identify what elements were shorted. But the TR4 is behaving very nicely now.

That would be a pretty rare T-4X, I reckon and I should snap any up that I see - even though they'll not be as easy to tune. Have to admit, though, that I've never seen one.

12120. Making new Plastic Dial Scales for the Drake 4.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-20 15:24:30 UTC
From: sm7dlk
Topic: 12120 Message: 12120

I just want to share some ideas how to make new dials.

I have seen many discolored plastic dials on Drake 4. The last one I saw was so ugly that it was difficult to read. I don't know why some dials does not have the slightest trace of discoloration while others are very ugly. Maybe some old dials can resist UV-radiation and others not. I like to experiment and read below what I have done. I am very satisfied with my result. There are companies on the market who can to make dials but the cost will be high.

How I have done:
First I produced an image of the original dial, in this case a dial from a T-4XB.
The image was printed on transparent film for OHP.
The film was placed between two thin transparent plastic discs cut to the same diameter as the original dial. I used two of these transparent CD-discs which you get for free when buying a pack of CD or DVD. The thicker edge or rim at the center of the plastic disc must be grinded off to make thickness even. Avoid scratch the plastic. The film is placed between the two discs. The clip on the shaft will hold them together. This method is OK to use on Drake 4 with a single dial. Looks like a brand new dial when installed..

I have also tried the "transfer method". Same method as we use for making PCBs using an iron. This is however a time consuming method. The dial-picture was printed on glossy paper and an iron was used to heat and transfer the picture. This method will work as well but be prepared to fail before finding the correct heating time. I used less than 10 seconds with high pressure during my experiments. There is plenty of information on the Net for this technique.

The transparent film is a bit flimsy that's why I used two discs above. I didn't try the film on a single plastic disc and gluing it to the area that is not visible. But this is probably the best and simplest way to make dials.

I did all my experiments with plastic from clear CD discs. This material is very brittle to handle but it was what I had available.
There is a picture on the dial for the T4XB in the my Photo directory

See the above as an input to your own experiments.

Date: 2013-02-20 15:32:46 UTC
From: Al Schichler
Topic: 12092 Message: 12122

I'll take some pictures of it soon and send them out. Looks like there are a couple people interested, so I'll have to sell it to the person with the best offer. (I would like to get at least $200 for it, preferably a bit more.) I paid more than that for it and put in quite a bit of work cleaning and lubing, repairing a couple problems, and doing a complete alignment on it.
It works beautifully, which is more than I can say about any piece of equipment I ever bought used.

From: woooey
Topic: 12125 Message: 12125

Thanks Garey for pointing me to this group.

I am the second owner of a 2B/2A-Q in reasonable condition.
Electrical performance is excellent. There are a few
things that I'd like to improve:

- the dial pointer sticks occasionally (but seemingly
only when in the case, hi)
- the upper chassis surface is dusty and lightly pitted
- the switches are a little noisy (electrically)

I plan to replace the electrolytics sometime. Any other
measures I should take to preserve this nice radio?

HI Ian -

Welcome to the group!

The 2-B is a terrific little receiver, LOTS of them still in service, and quite a few users in the
group.

The sticking dial pointer MAY be the result of panel/chassis tension created when cabinet screws are
tightened. Can be frustrating, perhaps someone else will have a direct idea.

Absolutely the first thing you should do is be sure there is a 0.6A fuse in the holder. I haveseen
scary things in there, and especially if you do not immediately replace the electrolytic, the
correct fuse may save you a power transformer.

The electrolytic is about 40 years past it's expected life, so ..... That said, there are hundreds,
perhaps thousands, of 2-Bs out there with the original Twist-Lok in place. You're aware of
Hayseedhamfest, and Tom can resolve that problem when you are ready. The film capacitors Drake used
are quite reliable, and I have yet to see a leaky one that hadn't been burned, melted, dented, etc.,
earlier.

The 8BN8 IS the correct tube. See my article at
<http://www.wb4hfn.com/DRAKE/DrakeArticles/Why_8BN8-2B.htm>

There were four versions of the schematic, most for changes to the AVC circuitry. You might want to
take a look at my CD for the 2-B if you're going to do much with it. It contains all four
schematics, high resolution color photos of theunderchassis, with components annotated and keyed to
a parts list. Samples at k4oah.com.

Donnie, at 2bradioparts.com has a nice selection of cosmetic and repair parts for the 2-B.

Again, welcome, let us know if we can help!

Hello Ian
I also own a 2B that just finished "restoration". I can recommend a few things that helped me through the process:
1. Purchase Garey's CD..it really helps
2. Purchase the capacitor replacement kit from Donnie. I also bought the dial Noogie, new bulbs, and correct fuses.
3. Also replace the main electrolytic in the p.s. Tom's will give a better look; Donnies will work fine. I used Donnies in my
     2B and Tom's in my SP600.
4. I used Chapstick as lubricant on the dial pointer to have smooth action (no sticktion). Also straightened the shaft of the
    main tuning knob that moves the dial cord (mine was bent).
5. I cleaned the chassis with Simple Green with no problems. You need to let it have ample time to dry before applying power.
    It took nicotine and grime off the chassis. Did a good job on the white panel behind the dial. I did not get it on the dial.
6. I have not found a way to make the chassis look good where the copper is corroded. So I simply bought some copper paint and
    painted over the bad spots. Doesn't look like collector quality but better than before.
7. Check your radio for modifications...mine had a couple so I brought it back to original.
8. Use De-OxIt sparingly on switch contacts...I do not recommend spraying them. And lightly lube other shafts on the chassis.

I didn't want to spend a lot for a calibrator, so I bought a solid state one from the auction site for less than $20.00. Mounted it on a
couple of stand-offs and wired it to the Calibrator socket pins. I used a rectifier and capacitor to get about 9vdc from the filament
AC voltage for its power, and switch it with the front panel switch. Works good for me.

I repainted the cabinet with Krylon Satin black paint and its pretty close to what was originally on it. Cleaned and polished the knobs
and painted 'arrows' with silver model paint.

Alignment with accurate test equipment helps a lot too. And, I put in all new tubes. Hope that you can get some ideas from my
experience. Its a great little receiver when restored.

Wes

12128. Drake Series 4 Station needs new home and TLC

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-20 20:49:14 UTC
From: daveincaol
Topic: 12128 Message: 12128

The son of GM3XIJ (RIP) has asked me to sell on rigs from his Dad's shack. He had a Drake 4 Station which consists of a T- 4XB S/N 15121G, R-4A S/N 6807B, MN-4 S/N 982, C-4 S/N 327 and a MS-4. He seems to have had power supply difficulties and has made notes re a 'new power supply' which I don't have. The station appears to have been replaced with a TR-7 and P/S which I also have.
The equipment is not in pristine condition. The upper horizontal chassis plating is corroded on both RX and TX. All other surfaces are bright and shiny. All tubes appear to be in position. The cases mostly need a refresh and in places possibly a repaint. The facia, dials and knobs are mostly good, the tens, units and second dials on the C-4 clock are discoloured and the clock is probably the 50c/s version. The exception is the MN-4 which is in very good condition and was likely retained in the shack alongside the new TR-7
I have lots of photos I can upload if someone tells me how or that I can email once I have an address. I can take more from any desired perspective.
If all 5 packages were delivered to the same USA address then the total carriage would be of the order of $170. Separately the carriage would be of the order of $70 each package.
Given the above information and the need for work and restoration I believe they would benefit by being repatriated to where there is an active interest in the equipment. I don't know how much they might be worth and will have to check any offers against completed sales on FeePay.
I would appreciate any advice and comments.
Thanks DaveB GM6WCF

Nope. It's wonderful. :-)

Seriously, this is a Yahoo group and you can set it to send you emails
in plain text or HTML. Your choice. Go to <http://groups.yahoo.com> sign
in, select this group and modify your settings to plain text mail.

While that's true, I'm set for plain text, and I got all the RTF tags
amidst the text, so something didn't parse correctly.

12133. Off Topic ? - Heathkit Educational Series

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-21 04:08:34 UTC
From: GlenH_KI4FMC
Topic: 12133 Message: 12133

Hello!
This is one of my first posts to any of the Yahoo Groups so please bear with me if I make any mistakes. I am hoping someone can help me.
I am trying to find some of the Heathkit Educational Series books but without any success despite following every lead that Google listed under several categories. The series are:

1) Passive Circuit Design, by Leonard F. Vincent, ISBN 978-0871190208,
Pub. Heathkit-Zenith 1983

2) Digital Circuit Design, Books 1 & 2, by Staugaard and Larsen,
ISBN 978-0871191120, Pub. Heath Company 1986

3) TTL and CMOS Circuits, Pub. Heathkit-Zenith 1987
ISBN 978-0871190017

I have many of the other books / series and this would pretty much complete the ones that I would like to have. I am also trying to "Elmer" several other new hams and soon to be hams. After 35 years since electronics school and 62 years old, the mind isn't as sharp as it used to be. I'm sure several of you can relate to this !!
If anyone has any of these books and would be willing to sell them please let me know.
Thanks in advance !!!, Glen

Check on Amazon. I just did under under the author's name and found the first book for $2.41. The others will be there too. Sometimes they are unavailable; then they become available. That's the nature of used books on Amazon.

It's a great resource for used and out of print books. It's amazing what you can find. Bob, NZ5A

12144. Draje 1A S Meter Problem

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-22 02:43:43 UTC
From: theblimp68
Topic: 12144 Message: 12144

Hi All,
I am new to the group. I am having a problem with my 1A S meter. All S meter functions seem to be working with one exception. When I use the mute function the S meter needle takes off like a rocket and crashes into the stop at the right side of the meter. If anyone has a 1A please check and see if your radio does the same thing. I don't know how the radio SHOULD perform from experience. From my experience with other Drake radios (2B, R4B) it should be a leisurely trip not a rocket ride! I would guess that there would be a cap to slow the rise in voltage somewhere that might be open.
73, Bill

Topic: 12144 Message: 12145

Hi Bill -

Welcome to the group!

It's been over 50 years since I had my 1-A, and I don't recall if the S-Meter acted as you describe
or not. Generally speaking, this sort of meter activity is not harmful, as long as it doesn't bend
the needle. The inexpensive meters that Drake used had some 'mechanical' damping of the meter
needle, and I have seen cases where this damping has disappeared, making for a 'jittery' meter.

TheS-Meter circuit is somewhat different in the 1-A from the later models, but I don't see anything
that would directly affect this performance.

The only other thing I see is increased ESR in the filter cap sections C83A and B could possibly
affect this.

Hopefully someone with a1-A willbe able to give you a more informed answer!

Again, welcome tothe group!

Just a shot in the dark.

Perhaps the agc r/c values are Lon out of whack.

No agc cap could explain the rapid meter movement.

Hi Barry
Thanks for the kind offer,
I'll see what size I need, the ones in the Tuner are 5/8th inch tall and 1/2 wide,
Trouble is I am not to sure what screw size they are.
Hopefully someone will tell me.

I guess they got broken, when the Tuner was Mailed to a previous owner.
Its in excellent condition otherwise.

12151. those little pcb inside the drake radios. How do you remove the parts?

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-23 18:06:39 UTC
From: qrper
Topic: 12151 Message: 12151

Guys,

I guess calling them pcbs is technically not correct. Since they don't have traces. But for a lack of a better description...

What's the best way to remove a component? Some I can get to, others if I grew an extra arm and some if I stood on my head with the radio tilted just so.

Then there is the part that I can't see anyway of getting to unless the board is removed or loosen so it can be bent over to get to the opposite end of the part thats coming out.

so, what's the best way of removal and replacement of those parts mounted on those small boards? Is there a better way?

mike, wb8vge

12153. Low audio from R4a

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-23 18:13:10 UTC
From: qrper
Topic: 12153 Message: 12153

Gang,

I'm bringing back a dead R4a and now there is life in the old girl. The chassis is not bad and the front panel is okay... far from perfect but then again neither am I.

I can easily hear 1uV and MDS level is .02uV. Haven't touched the alinement and may not even mess with it.

however, the audio seems low. I need to put the volume control at the '3' o'clock position for normal audio. In the stops, it distorts, like it should.

the 6EH5 audio tube tested high grid leakage, and the sub didn't make a bit of difference to the audio.

It hears good.... but the audio is not there.

ooooohhh..... I did notice this. When in the lower sideband mode and with the bandpass control on the row of dots on the left, the audio seems pinched. Normal, to my ears, is when I move the bandpass control more toward the center.

Could this be a reason for the low audio?

inquiring minds you know

Have you bought one yet? I have one that I bought with some other radio gear that I won't use. Don't know if it works can't test it either so I'm not sure what it's worth. Looks to be in great shape but I can tell that there is wear marks on the screws. And the man I bought the gear from said that all of the stuff had been sitting in his garage for about five years.On the other hand the R-4B seemed to work fine, he insisted that he show me that it worked. Let me know if your interested.

Mike -

No simple answer. In 'most' cases if you remove the mounting screws the board can be pushed,
flipped, whatever to make the components accessible. In 'some' cases the best bet is to have my CD,
or take your own photos of the board and wiring 'in situ' and then remove it entirely.

Takes patience. Insulated wires are best cut short or held on the stripped area with a pair of
tweezers to sink desoldering heat away from the wire insulation. I also use solder wick, a small
manual vacuum pump, a large manual vacuum pump, and a Hakko 880 desoldering gun as appropriate.

Back in the 60's at NASA we had special tweezers that had a nose with a hole through it and split so
that the tweezers could be clamped around a stripped wire end allowing you to solder it to a
terminal without solder wicking up the wire. The insulation was Teflon, so didn't have the melting
problem of the Drake wire, but wire terminations with solder wicked up under the insulation would
break under vibration testing. Wish I still had some of those tweezers!

By the way, many of the boards DO have traces. I prefer to think of them as multiple tie points. The
parts aren't necessarily related, and very unusual to have a 'circuit' on one board, just a place to
mount parts that aren't wired to tube socketterminals, etc.

s/n? Cathode bypass cap on the 6EH5.

Emitter voltage on the 6EH5? Emitter resistor value?

Pinched audio sounds like Passband tuner alignment, or perhaps just knob placement. Should peak
sharply in the middle of the shortest line on 400 Hz selectivity.

Date: 2013-02-23 19:38:06 UTC
From: Robert Logan
Topic: 12144 Message: 12157

Or maybe the resistor associated with the cap has gone way out of value. It is the second part of the delay circuit for AGC in older radios. Maybe in newer radios too but I don't know about that.

A higher value resister will discharge the cap quicker, giving 'fast' AGC while lower values will do the opposite. If I'm wrong on that, somebody please correct my info. Bob, NZ5A

Just a shot in the dark.

Perhaps the agc r/c values are Lon out of whack.

No agc cap could explain the rapid meter movement.

garey,

It's a 11 tube version and I don't have the number off hand. The shack is in the basement, computer upstairs.

The cathode resistor has been replaced a week ago. The little bugger had an almost invisible hair line crack in it. The cathode capacitor had been replaced, too. It had green things growing out of it.

I purchased one of your cds, but you think I can find it? Nope...

I found a start up disk for a tandy 1200 computer, a cd full of MS-dos software for the ARRL antenna book, a zillion others, but no drake cd from you.

I'll take some voltage readings and see what's going on at the base of the audio output tube.

thanks Garey,

I can't find my manual for it as well as the cd..I'm using a r4b manual in the time being.

on this radio, the r4a, there are two small trimmers. One i know sets the agc gain and the other the s-meter.

what one does what and how to you adjust them?

and speaking of adjusting, I've got a 2A on the other bench. I know you set the zero from the pot behind the front panel, but when I set the rear pot to an agc level of 1.5 volts, the receiver really gets quiet. am I missing something here? How do you set the level of the s-meter?

too many projects going on at the same time

Greetings!

No, I'm still w/o a wattmeter, but I've bought so much unworking stuff lately that I'm hesitant to add to the collection. Time is something I don't have much of, anymore.

Great nickname, BTW - been a long time since I've thought of The Mighty Quinn. I've been to Dayton once while in the service, don't remember if it was west or east of Cleveland... I keep saying I'm going to the Dayton hamfest before I kick off, but...

I'm a member of this forum. After many years I will be selling my collection of Drakes.
I will list them here and then will begin entering them on QRZ and QTH individually for sale.
On those sites, I will also list the various s/n numbers.

I have 2 sets of Drake twins: 2 T-4x's with R-4 and an R-4B. Both of those with MS4 and AC3's.
a TR4 with factory installed NB and matching MS4 with an AC4 PS. This Tr4 is a 9.5 out of 10.
Shire 444 and a D-104 amp type. Hammarlund HQ-100 also available.

Look for the ads to appear on Monday. I thought that I would start here with the true enthusiasts first.
I will send pics soon. Thanks. Bob.

Woman is 55, But Looks 27
2013's No. 1 Cream. Mom is Wrinkle Free Thanks to Doctor's Secret!

12172. T4XC DIAL BACKLASH

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-24 20:15:18 UTC
From: zl1bbw
Topic: 12172 Message: 12172

T4XC.. turn the tuning knob clockwise its fine smooth as, dial goes smoothly turn the knob counter clockwise and it takes a full turn before the dial starts to move, then its smooth.

Any clues on where to start? thanks Gavin

p.s. found the fault on the T4XB no output, just about to start checking voltages etc, when had a bright idea and checked the piece of coax from Tx to swr meter, on that TX is had gone open circuit, hence why when I moved swr/dummy load to other rigs it was fine. I always leave one piece of coax plugged into back of Tx's makes it easier to connect up. Very happy with that result.

Gavin -

Sounds like classic clutch wear. LoosenMAIN TUNING knob setscrew, press in on knob and hold while
tightening setscrew.

If this is the problem, you can probably improve things by taking some sandpaper to the ENDS of the
little section of rubber/plastic tubing just behind knob skirt plate. A piece of auto rubber tubing
(3/8" i.d. / 5/8" o.d. X ~1/2" long) with the ends cut SQUARE is a suitable replacement.

Unfortunately nothing, get a speaker click as the power goes on to the board, just checked got volts and earth on the 4 pin plug, but no action. Anything that normally goes phut on these? or just a case of checking through the board components? Thanks

12179. Re: [DrakeRadio] Bringing my TR-4 back to life... almost there

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-25 00:49:13 UTC
From: Mark Pilant
Topic: 11909 Message: 12179

A couple of days ago, I ordered some parts for the TR-4 and my L-4B from Mouser. They should be here is a couple of days. In particular, I waiting for the (proper) replacement MIC jack. (Unfortunately, I forgot to get a replacement for the choke which was toast. Lucky for me it is only needed if I want to have a separate receiver :-)

While waiting for the jack, I have gone about half way through the alignment. I've done the receive parts, and have just started on the transmit portion. I was a bit surprised to see that for most of the receive adjustments, things weren't too far out.

It has been nice to be able to listen on all the various bands as I poke along getting this rig back into shape.

Not too far down my list of things to get is a spare set of finals. As I was starting on the transmit alignment, I had the rig just barely (really idling) transmitting into a dummy load and I happened to see a single flash from one of the finals. I did actually try upping the power into the dummy load without incident. But....

Hopefully I'll get some more time before too long to continue on. Then I'll do the happy dance when I put the covers on for the last time :-) :-)

Oh yes, when I got the rig it needed some serious cleaning. I wasn't sure where all the "crud" came from until today. As I turned the rig over so I could get to the underside of the chassis, I noticed a couple of pieces of acorn shell on the work bench. Gee, I wonder where those came from :-) :-) :-)

Garey-

Installation of new resistor is complete and the RV-4C seems to work
well. Even that 10 watt resistor gets really warm. I have noticed that
when using the RV-4C signals are about 10 db stronger on the S meter
(and sound stronger too) . Is that normal ?

12181. Early AC-3 Power Supply

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-24 23:08:51 UTC
From: Fraser
Topic: 12181 Message: 12181

Does anyone have a schematic of the early AC-3 power supply? The one without can caps on the top, but with all the caps underneath the chassis.

I have one coming, and I'd just like to get replacement caps beforehand.

Thanks,

Fraser, W3UTD

George -

OK. Keep in mind that 2W of heat is 2W of heat. The only difference in a 1/2W and a 10W resistor is
the ability of the package to a, withstand a certain amount of heat; and b, the relative amount of
package to air interface is available to get rid of that heat! That 10W resistor is dissipating
the same abount of heat to the atmosphere as the 2W was, just transferring it more efficiently.

Usually it's the other way around! The cable capacitance tends to load things down. Be sure there
is a 12AU7 in there and not anAT or AX. Otherwise I wouldn't worry about it.

Now that the TR-4 is working fine, which amp does one buy? Leaning towards FL 2100 B or SB 200 (financial limitations apply). Do have one line on Drake L4B without tubes that sure would look good beside the TR4 and Matching MS4. With that said are there major complications hooking the grounded grid 2100 and 200 to the TR 4,,,will an external relay be needed and what about this alc from pin 3?(I don't have my manual in here right now) to the alc to an amp? Not to worry yet about hook up, I bet they can all be hooked, any advice on 2100 versus sb 200..yeah, I know the 200 would probably be the best choice, but darn that LB would look good but bidding will probably put it out of reach...thanks for all the help guys but the tr 4 is doing a great job as of now....another.

Where and when is the Drake Net? tnx de HXB.

I'll also be looking for a 1.5 kw tuner...de HXB.

>
Gavin -

Try pulling up slightly on the board. I have seen a few where component leads were not cut short
enough and when pressed fully down they shorted to the chassis.

You can try adjusting the trimmer capacitor a couple of turns one way andanother and then returning
to where it is.

Also, check the voltage on the big electrolytic and the smaller tantalum capacitor. The Zener diode
should have very close to 10.00 VDC on it. If DC voltages are correct, and assuming you cannot hear
the 100 kHz markers at all, possibly a bad FET or even a crystal. MPF-102 is an ok FET if availability is a problem.

12190. Re: Drake R-4A, R-4B, or T-4X plastic dial scale

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-25 16:48:26 UTC
From: Al Schichler
Topic: 12050 Message: 12190

I just thought I would send an update about the plastic dial scale.
I have access to an industrial environmental chamber where I work, so I clamped the dial scale between two 6" square pieces of glass and put it in the chamber at 45 degrees Celsius (about 113 F) to start. It was flatter, but not perfect, but after raising the temperature to 55 C (about 131 F) for about two hours, it was very flat, about like when it was new.
If using an oven, it would probably work fine if it can be set to somewhere between 120 to 135 degrees. I don't know how easy that would be to maintain with most kitchen ovens though.

Another thing I found out was that I could use rubbing compound and polishing compound on both sides of the dial scale without any of the numbers wearing off. The printing seems to be sandwiched inside of the plastic, so it doesn't rub off. That make it easy to remove fairly deep scratches without ruining any of the numbers.
At least that was my experience with the R-4A plastic dial scale (the later one without 5 kHz markings).

Al,
WA2S

12191. TR7 For Sale

Yahoo group: DrakeRadio (2013-01 — 2013-06)

From: Adrian Rees
Topic: 12191 Message: 12191

All

I have a Drake TR7 & Power Supply For Sale.

I purchased the non Working, but complete TR7 & PSU in 2008, with the intention of restoring it to full working order.
Alas I have no spare time, and for the fore seeable future won't have time to devote to this project. So its For Sale.

The Transceiver was dead when first acquired, and a staright forward replacement of the Variable Resistors in the Power Board brought the RX back to life.

Since then nothing has been done. The TX may work, it may not!

Clearly the Power Supply works though !

Its located in North Wales (UK) complete with a few spare boards & parts, and is mechanically complete.

Happy to ship world wide, althoughg it will be expensive, due to weight.

Reasonable offers please !

Happy to photograph (at the weekend) to those interested.

Email off list if interested: rees.a@...

Cheers

Adrian MW1LCR

12192. R4B intermittent passband

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-25 18:42:32 UTC
From: jnminni@att.net
Topic: 12192 Message: 12192

My R4B has developed a new "opportunity" for me to work on. The passband tuning has developed an intermittency similar to how a dirty pot would sound when you wriggle the knob. Now I think that inside that passband tuning box there is just a slug that moves in and out of an inductor. So I don't know how to begin with this. Possibly a broken wire or loose connection inside the box would cause this. I suppose that it is also possible that dirty contacts in the bandwidth switch (that shares a concentric shaft with the passband tuning) could be the problem, but really it seems more like it is the passband tuning itself. How would I begin to work on this? How difficult is it to get that passband tuning enclosure apart and, more importantly, how difficult to get it back together.

Thomas,

Back in the days of TV sets that used vacuum tubes (valves) it was often necessary to remove the back of the set for servicing. The mains cord terminated in a female plug that was attached to the back of the set. This female plug mated with a set of male pins attached to the chassis. Thus mains power was automatically removed from the chassis whenever the back was removed from the TV set. Sometime this female plug was attached to the back with rivets, sometimes with a metal clip. This arrangement was sometimes found on tabletop radios.

TV service people had a cord with this female plug but no mounting ears in their toolbox. It was called a "cheater cord" because it allowed the service person to "cheat" and operate the TV with the back of the set removed.

I do remember removing one from an TV set back and cutting off the mounting ears.

I have seen them on ebay typically going for $5 to $10.

73,

Bill

Thomas-

All Electronics has them here in the states. I called their toll-free number: 1-888-826-5432 They told me they will ship to Finland. You can use Paypal but the package will have to be trackable with a number. Here is the part itself:

http://allelectronics.com/index.php?page=seek&id[m]=pattern&id[q]=cheater+cord&x=0&y=0

This will probably cost a bit of money. Maybe buy a few extra things while you're on the website, HI!

Remember that the 1410 keyer was designed for 120V as I recall.

John -

Look at the back of the PBT box whilst turning the PBT knob. All four slugs in the square arrangement should go in and out. If they don't move or only move after a delay then you'll need to take the box apart, clean and re-grease the mechanism. The slug carriage pulls straight out once you've removed the rear cover (you'll have to break two solder joints and remove some screws).

The slug carriage is under slight spring tension and when the grease is fresh it moves freely.

If you have Garey's CD, it's in the "Misc" Folder, "PB Tuner Mechanical".

Thomas, can you get adaptors at your local electronics store? I don't know if you have Radio Shack there (I think I've seen one in Germany, but that was years ago), but they sell them. I'm assuming you have the typical Continental receptacle like they have in France and Germany...

You will still need to make sure you either have the ability to move the transformer primaries or have a step-down from 230 to 120.

73,

Steve Wedge, W1ES/4

Hey Joe;

Sorry to say, but I don't really know what U mean by "cheater cord" - As you might know we use 230 V mains here, so we have no plugs/sockets with those dimension in the junk box... Maybe someone can supply one of those if they get compensation by some $$ (paypal?)

Does anyone have a schematic of the early AC-3 power supply? The one without can caps on the top, but with all the caps underneath the chassis.

I have one coming, and I'd just like to get replacement caps beforehand.

Thanks,

Gang,

this is one case where one size won't fit all.

those 1410 keyers did use a cheater type power cord, but the pin spacing is much closer..I've found that the panasonic power cords work and fit like a glove.

mike, wb8vge

ooh... the power cord for the sb303 and others is a cord used by adding machines as well as other business equipment.

From: oh6nt
Topic: 12193 Message: 12207

Hello again. Thanks to all for answers. I've managed to find a suitable cord from a gadget delivered with an US cord, which is a snug fit, so the keyer actually works now. The plug is not the original, but the original would be hard to find.

Someone warned that the unit ia wired for 115 Vac, but that is changeable by a jumper on the PCB. And, since somebody has nicked the original transformer, the new one (found in a PC speaker system) works just fine on 230 Vac. Fortunately it had same mech specs that the original...

Hava a good time with your Green Lines and Drakes!
It's good to be green - Get a Heathkit!! :-)

Could be. The exciter boar is where all the transmit audio happens. It's possible that the small coax cable from the mic connector to the audio board is shorted. The mic gain pot is also connected to the audio board.

12209. Drake Cabinet Painting - Hartzell Manufacturing

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-27 15:22:10 UTC
From: Paul Christensen
Topic: 12209 Message: 12209

This morning, I contacted Hartzell to inquire about Drake cabinet painting. About a year ago, a message appeared on one of the mail boards that they were discontinuing this service. Thinking perhaps they had reconsidered, their customer service manager just confirmed they will no longer paint our Drake cabinets. I suppose for the little financial return on the work involved, it was no longer viable.

I know this could shopped around locally, but would like to use someone with experience and who knows how to replicate the Drake cabinet finish. Thanks!

Presuming you are talking about black, whether spackled (bumpy) , or plain. I have no experience with the 7 series gray. The 7 line black straight paint cabinet replacements were exactly that, see below.

The black put out by Krylon worked very nicely. This was at the time a "semi flat" The needle that did not twist for vertical & horizontal spray. For straight paint 2 to 3 thin coats. For the spackled you needed a couple of cans. Take a needle and poke into the spray jet just enough to put out a not large spittle of paint...this takes some work and practice on something (several times) The spackle is your first coat. Now do a couple of thin straight coats.
Good luck, Carl wd8nhk

If you are going to do this, the original paint was done in one application and Sherwin Williams paint was used called Polain. To try and replicate this the base coat needs to be sprayed with black SATIN. Then the speckled paint needs to be black gloss.
In other words the sheen is not the same between the base black and the speckled black.

Yes to the above. First time I did it with a straight pin and made the hole to big. Suggest enlarging just a bit at a time until you are happy with what comes out. If you look at Drake spackle it is not very large droplets. You will be consuming more carrier for x amount of paint.

An in my opinion critical point that I don't know exactly how to say is my mixing schedule which is about shake the can up after typically one surface paint IE I paint the top of a TR4 cabinet and then shake the can again... Carl wd8nhk

As I have pointed out numerous times to members on this reflector and others

(1) The specified paint #1613 is no longer available and the Krylon recommended "same as" is NOT same as
(2) Drilling out the present day EZ touch nozzles does NOT work like it did on the "old fashioned" nozzles

The internet is a wonderful place full of information. Too bad it does not self purge out of date information

Et all,

In terms of painting technique, the WB4HFN web site offers cabinet painting procedures via this link:
http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/CabinetRepainting.htm

Provided are Krylon spray paint part numbers, drill bit size (for the purpose of modifying the spray nozzle), sand paper grit, etc.

Hope this is helpful!

Have used the WB4FHN method to great success. There is a photo of a TR4CWrit on my QRZ.COM site that I restored using this method. DAN, K3XR

12223. Drake TR-4CW cleaning and problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-28 15:21:42 UTC
From: slowcountry1
Topic: 12223 Message: 12223

About 20 years ago I received a Drake TR-4CW from my step grandfather after his passing. I received it in full working condition; about 4 years afterward I decided to start using it. I rebuilt the power supply and everything worked quite well. After an absence, the unit has set on a shelf for the last 8 years. I pulled it out and found the power switch open. After unsuccessful cleaning attempts with Deoxit D5 spray, I decided to short the switch and the unit tunes up and receives as expected. The band lights work sometimes and not others, suspect dirty connections. Any insight here?

Now that the history is out of the way, my real question is about cleaning the chassis. It has some dust and what I expect to be some nicotine from Grand Dad. I rubbed my index finger across the chassis to see how difficult it would be to remove the crud and to my dismay, while the crud came off, so did the tube lettering I was rubbing over. I used very little pressure. I am concerned if I use any type of cleaner that all of the chassis lettering will be removed. Does anyone have any suggestions for cleaning the chassis.

As I stated, for the exception of the power switch, the unit works fine. I was going to clean all of the switches with Deoxit D5 spray but I saw somewhere that this may actually be bad on the insulating discs. Should I leave this thing alone and be happy that it works or are there better way to approach this?

Thanks,

Doug

12224. Drake TR-4CW dial calibration

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-28 16:33:10 UTC
From: slowcountry1
Topic: 12224 Message: 12224

When I set the selector switch to cal, I get the expected tone at 100Hz intervals however, I do not get a zero or null I can adjust the dial to. I get the tone, adjust the dial just to the right of the tone, where I here nothing. If I rotate the dial higher I do not get a tone but If I rotate the dial lower I get the tone. I was expecting a null point in between two tones to calibrate the dial to. Am I doing this completely wrong or do I have an issue with the calibration tone?

Thanks,

Doug

Doug try switching sidebands. There's no pbt on the transceivers, iirc.

Never heard of the chassis lettering coming off. I put mine (especially rigs that belonged to smokers) in the kitchen sink, spray w simple green and rinse. You have to remove the front panel, PTO and tubes.

Not for the faint of heart bit it results in as good-looking a radio as you'll get.

First of all the neon PTO indicator; these lamps wear
out, the trigger voltage goes up. The cure is to replace the
lamp. They are available from the various lamp sources on
the web and are not expensive.
You should be able to get a zero-beat from the
calibrator. Describe what happens as you tune across its
markers, do you get a tone of varying pitch? You should but
finding the exact zero-beat may be difficult because the
calibrator signal will be at the margin of the filter. You
will NOT get a null on the tuning meter because the
calibrator signal is like any other carrier, its there, what
you get is an audio zero-beat.

Doug -

Welcome to the group!

I believe what you are seeing is the result of eight years of storage in less than ideal conditions. Dirty (corroded, oxidizes, etc.,) switch contacts would present as what you are seeing. D5 is probably not strong enoughto break through! I like D100L liquid in the small bottle
with the needle applicator top. This allows you to apply strong deoxidizer right on the contacts
ONLY. SOME so-called 'contact cleaners' seem to be capable of swelling phenolic wafers,causingcontact alignment problems, but I've not seen that with any DeoxIT products. Spraying
is still a bad idea, because any overspray serves to collect dust and even form carbonized leaky paths.

The power switch may be repairable. They CAN be removed and contacts cleaned, etc. Afailure of the
camming mechanism may be fatal. Does the power switch 'click' when operated? If it does, it can
probably be repaired.

Cleaning the chassis is tough. If the lettering is wiping off with your finger, most any cleaning
method is going to do the same. I would just clean it the best I could, and then replace the
chassis lettering with dry transfer lettering.

Your 'missing' zero-beat is because this is a SSB transceiver. The filter passband does NOT include
the Carrier Oscillator, so you hear the beat note from about 2.7 kHz down to about 300 Hz. If you
crank up the gain you might be able to hear below 300. However, if you tune across the Calibrator
one way, you will hear either 300 - 2700 Hz beat, -OR- 2700 - 300 Hz, depending upon which way
you're tuning. If you switch tothe 'other' sideband, and tune through in the same direction, you
will hear the opposite of the above. Think of the letter "M" with the zero beat in the center
trough. Depending upon the sideband selected, you will hear ONLY one of the 'peaks' of the "M".

Richard,

I am not understanding the lamp and trigger voltage comment and how that applies to the Cal issue, can you please elaborate?

If I set the VFO for 28.300 LSB and turn the switch to Cal, the tone can be found above 28.300. I can rotate the VFO through the tone and I do not find a null to zero on. If I change to USB, the tone is found below 28.300, when I rotate the VFO through the tone, again no null is found, the pitch varies as does the S meter. It sounds like it tries to make a tone on either side but it is almost non audible and would not allow for adjustment via the ear.

If I switch to CW and transmit, I have adjusted the dial to align with 28.300 on my hand held MFJ freq counter. Again with the dial on 28.300 lsb tone is above and usb tone is below. Not two tones or a null in the tone. I have tuned very very slowly to see if I was just missing it but the null is not there.

Gary,

It is rather disheartening in that the chassis is not pitted, oxidized etc. It has been in my ham shack (upstairs unused bedroom) in a stable environment. It is not really dirty just a light film of dust; but yellowing that I assume is old cigarette smoke related. Very easy to wipe off however; the lettering comes off with the wiping of the finger. How do you re-label it as you described? Is there a website or something you have written?

The power switch clicks as expected and has no sign of burning. I have 3 other T4 T4Cw-rit that I purchased as projects (never touched) their power switches all have obvious burns external and are open. So much for robbing peter to pay Paul.

I posted my findings on the zero beat below;

If I set the VFO for 28.300 LSB and turn the switch to Cal, the tone can be found above 28.300. I can rotate the VFO through the tone and I do not find a null to zero on. If I change to USB, the tone is found below 28.300, when I rotate the VFO through the tone, again no null is found, the pitch varies as does the S meter. It sounds like it tries to make a tone on either side but it is almost non audible and would not allow for adjustment via the ear.

If I switch to CW and transmit, I have adjusted the dial to align with 28.300 on my hand held MFJ freq counter. Again with the dial on 28.300 lsb tone is above and usb tone is below. Not two tones or a null in the tone. I have tuned very very slowly to see if I was just missing it but the null is not there.

Ok, that makes sense now, I wasn't making a connection on that one.... I removed the lamps and rubbed the lead base on my blue jeans just enough to polish them up. Seated and re-seated them a couple of time and viola, the now both work. The bulb and socket looked great but apparently there was a slight oxidation on the lead that wasn't allowing them to work properly. Getting the sockets out with my big hands was a task...

Never heard of the chassis lettering coming off.
Oh yes, my old R4 did too. Old age like the owner. Carl wd8nhk
Come to think of it I had a TR3 that lost the tube lettering on one side
while cleaning with a damp rag.

Doug -

Refer to my "M" description below. Your 'zero beat' is at the bottom of the center trough of the
letter. The Upper and Lower sidebands are the two peaks. Each allows you to hear from ~300 - 2700
Hz on either side of the zero. The '300 -0 - 300' Hz range is outside the filter passband(s) and so
not heard.

You used to be able to purchase lettering packets designed for lettering front panels of home brew
equipment. The idea is that the letters are a waxy substance adhered to a cover sheet. You placed
the letter or word whereyou wanted it on the panel, rubbed it with a burnishing tool, transferring
the letter or word to the panel. The finished panel would be sprayed with a clear fixative spray to
protect it.

A better idea available today is at

<http://www.hyatts.com/art/dry-transfer-letters-1.5303>

this is a special paper allowing you to print your own 'words', symbols, etc. on a laser printer and
then generateyour own titles. (Tube numbers?)

Gary,

I apologize for my ignorance in advance. If I'm understanding your analogy correctly, if I'm in cal mode and I change to either side band I should not hear any tone on 28.300 but I should start to hear a tone above when in LSB and start to hear a tone below when in USB as I move the VFO?

Is there value in setting the transceiver in CW-X and monitoring the transmission with a freq counter when finished?

Thanks for your help, again I apologize for my ignorance.

Doug

Doug -

Let's try it another way. Let's say youare tuning to a dial frequency of 1,000,000 Hz. If you
being tuning from the lower frequency, up, you will first hear a tone of about 2,700 Hz, and a dial
frequency of 997,300 Hz of the LOWER Sideband. If you continue in the same direction, you will hear
the tone decrease in frequency to about 300 Hz, at adial reading of 999,700 Hz. The signal will
then 'disappear', tuning through a dial setting of 1,000,000 Hz (zero beat) and then when you reach
1,000,300 Hz you will again hear 300 Hz, this time in the UPPER Sideband. As you continue, the
audio tone will increase to about 2,700 Hz again, at a dial setting of 1,002,700Hz and then disappear again.

For CW, the Carrier Oscillator is shifted ~800 Hz to place it WITHIN the LSB passband so it can pass
throughwith minimal attenuationand become the transmitted signal. As a result, the dial frequency
of the transmitter will read about 800 Hz off of the TRUE transmitted frequency.

That's an amazing transformation of the copper chassis. How did you do that?

12240. R-4B Bias and S-Meter alignment.

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-02-28 19:18:35 UTC
From: hglent
Topic: 12240 Message: 12240

I had a audio out put problem with the R-4B. The level was low, but occasionally I would hear a burst of hi level audio and back to low.

I got the instruction manual out and started looking for the problem. The AVC wasn't functioning properly. I decided to check the Bias and S-Meter. I started following the steps in 6.4.9. Every time I would go back to step 3 for a final touch up I ran into a Bias adjustment problem. It would change.

I consulted with our Guru of Drake Radio, Garey K4OAH. He gave the following advice; "First, are you using the Drake MS-4 speaker? It's a 4 ohm voice coil, which is what the 4 Line wants to see.

Setup is very straightforward. Section 6.4.9 in the manual. Besure and use a Hi-Z meter 10-11 M input impedance to measure TP2. The little Harbor Freight toymeters will NOT work. Set the -1.32 carefully.

Try step 4 as written, and see if you are pleased with the results. If not ...

Change step 4 to read: "Set RF GAIN control full counter clock-wise and adjust S-Meter SENS control to 60 dB over S-9."

If neither is satisfactory, measure the voltage you are able to reach with the RF GAIN, per the original step 4. You should reach -15V well before full CCW. If not, we may have to go further."

The only thing that was giving me trouble was no place in the manual or in the advice was there mentioned the proper setting of the RF Gain before doing the -1.32 VDC measurement. Again back to Garey. He advised, set RF Gain full CW before doing any adjustments and then follow the directions.

The outcome was perfect operation of the AVC and proper audio levels with plenty of volume on the speaker, plus the S-Meter was working.

Thanks again to Garey for his expertise and outstanding support to us all.

Gary,

I had done it in the reverse order as you described. I started out at 28.300 LSB, increased in frequency and shortly noticed the tone and returned back to 28.300. I then switched to USB and decreased frequency and shortly noticed the tone and again returned back to 28.200 and adjusted the dial so that no tone is present at 28.300 while in either LSB or USB modes. I have actually done it backwards then.

The next topic I need to ask you about is the plate meter dampening. I just had a 45min QSO on 15M with a gentleman and noticed that the S meter needle was flopping all over the place. When I stop transmitting it rests at Zero however sometimes it will bang back to zero and get stuck below the zero mark and requires a slight tap to put it back on scale. I'm assuming that there is a tiny coil type spring acting as a dampening device? Is this common in older rigs? Is this repairable or is the meter done?

Thanks for all of your assistance.

Doug

> The next topic I need to ask you about is the plate meter dampening. I just had a 45min QSO on 15M with a gentleman and noticed that the S meter needle was flopping all over the place. When I stop transmitting it rests at Zero however sometimes it will bang back to zero and get stuck below the zero mark and requires a slight tap to put it back on scale. I'm assuming that there is a tiny coil type spring acting as a dampening device? Is this common in older rigs? Is this repairable or is the meter done?

Paul,

Thank YOU for taking the time to give all of us a synopsis of what symptom you had, and what fixed it. That adds a LOT of value to this list, and I fear a lot who get help don't do that. Well stated!!!! I'll sure add your email to my archives.

It looks better on pictures. I applied copper-colored spray paint after cleaning the surface. The labels were printed on a sheet of transparent film and clear double sided tape was used to attach them. This is NOT restoration. The painted surface is not conductive anymore and the labels can come off, although I made sure it doesn't melt or get loose with the typical surface temperature of TR-3 chassis top. It was only done to the worst of three TR-3's I have.

That's an amazing transformation of the copper chassis. How did you do that?

We're talking just the cabinet shell, right? I would think that could be fairly economically shipped. Maybe some models would require the chassis? Not sure, I'm a newbie to Drakes.

I've successfully duplicated the "speckle" finish with the pin in the nozzle method, on a different brand of radio. I did the speckle with primer and then did a semigloss over that, turned out indistinguishable from factory. I cleaned and kept that nozzle just in case I ever need to get that texture again.

Anyone know gray what matches the TR7 cabinet? I've read about the "sticky" paint and the vinyl covered cabinets. I've got a less than lovingly cared for TR7 that's next in the queue for a refurb. Mine appears to be paint, but isn't sticky.

I'm redoing my 2B and 2BQ cabinets in Rustoleum satin black and as a test, before I sanded and primed I painted a section of it with one half of the original paint area masked. When I took the tape off and compared original and new side by side the color and sheen were as close a match as you could hope for coming out of a can.

BTW, as a follow up to my earlier 2B dial white sheen question, I ended up going with flat white and it turned out perfect. As long as you don't have a 2nd 2B next to it to compare to, I suspect any nuance of difference in "whiteness" or sheen would ever be detected. After 50 years I suspect all of them are in various shades of white anyway. And the white wire I was after I had to settle for stuff the same OD but it's a shade too white. I reached the point of diminishing return to find wire with the right shade of off-white to blend in. I'll leave that to the next guy that rebuilds it.

I've read all about the safety hazard of the 2-wire AC cord configuration and will be installing a 3-wire cord during my 2B restoration.

I have a supply of "real" Y-caps that I can replace the stock .01 ceramics. Is there any value to adding an X-cap or is that superfluous in this application? I don't see the 2B as being especially susceptible to, or generating any EMI but while I'm in there...

I've been trying to get Ron to post the updated document on his web page (WB4HFN.COM), but I see it's still not there. The Krylon paints you need are:

Krylon #51317 Rubby Brown Primer
Krylon #51613 Satin black paint
Krylon #51601 Gloss black paint

The drill size is still correct in the document, which is a #52 or .063 inch. Works great and get perfect match.

The 51613 Satin black works better than the old #5613 Semi Flat.

Hi Doug.

Given my recent experiences with my TR-4 stored in less than ideal conditions, I would suggest using the contact cleaner of your choice (I use Deoxit) on *all* contacts. The switches are obvious but I would also include crystal and tube sockets as well.

A cleaner/lube (as appropriate) would probably be helpful on the various pots.

I respectfully disagree

51613 is too shiny, only matches cabinets that have been waxed a lot
In my experience it is easier to start with the present day Krylon 15602 flat (there are only three choices , flat, satin and gloss) and buff it up to the desired lustre. Use the flat for both base and spatter and the spatter will gloss up more being on the top

If you want a closer match to the original 1613 try Dupli-Color 1608 Semi gloss lacquer but be careful what you use for primer or you will have wrinkle finish.

And, the enlarge the hole in the spray tip technique, has not, in my experience with the newer style nozzles, been any walk in the park. You will end up with paint drool all over the can, your fingers and the floor. The only way I have gotten it to work is work over a large sheet of cardboard and get the spatter started satisfactory and continue moving over the project without altering your finger pressure. Difficult to do---cramps my index finger

Just my experiences with black paint in a spray can. Only topic more subjective is what speaker / microphone is best

Pretty easy to blow almost $40 on round trip insured postage on a 4 series cabinet to the far corners of the 48 states. Then there is the packing material and time. Somebody has to pay the bill.
When the shipping costs almost as much as the paint job that seems significant.

Paul,
Lets agree to disagree.

I've painted probably 500+ cabinets with this technique and when done properly, it's perfect match. The flat is just too dull and if you sit the the flat next to either an original or one painted by Hartzel, you will immediately be able to tell the different. Not so using the 51613 Satin with the #51601 Gloss black for spackling.

So each to his own, just my experience.

Now as far as the drilling out of the nozzle. That takes some practice and I always tell someone just starting out to start small and work your way up to the larger hole diameter. You also want the droplets to fall onto the cabinet, so it usually works best to put the cabinet on the ground and spray 2-3 feet above and over letting the droplets fall onto the surface. Takes practice for sure.

Have fun.

OK
I can agree to that but please remember I said to buff up the flat with a reducer to the point it matches the original piece, which, in my case is trying to make some rebuilt piece blend in with other 50 year olds that were clean otherwise un-touched.
When I shot my series of test panels using virtually everything on the rattle can market and placed them on top of all my various vintage Drakes I had a couple of outsider critical eye folks do a walk by. Not one picked 51613 as even close.
True test in my mind. Un-biased by my opinion.

Paul,

This is what I use on all sorts of spray cans to relieve the "cramps
my index finger" syndrome:

http://www.lowes.com/pd_284850-90-241526_0__?Ntt=Rust-Oleum+Comfort+Paint+Spray+Grip&UserSearch=Rust-Oleum+Comfort+Paint+Spray+Grip&productId=3078199&rpp=32

12254. Plate meter and relative output issues

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-01 01:23:26 UTC
From: slowcountry1
Topic: 12254 Message: 12254

After a long QSO today on 15 meters, my resurrected TR-4Cw developed an issue with the plate meter and the relative output when the load control is depressed. The plate meter has become very "bouncy" during tune up or normal operation. It acts like whatever was used for dampening is gone. It bounces hard enough that when you stop talking and un-key sometimes the needle gets stuck below 0 and I have to tap on the meter to get it to unstick. The meter never pegs out and displays correct values, it just moves very rapidly without dampening. At or about the same time, I noticed that when I depress the load control to activate the relative output meter, this does not produce a deflection on the plate meter. I checked the switch with an Ohm meter and it appears to open and close properly. Any ideas on these issues?

Thanks,

Doug

12256. Re: [DrakeRadio] Re: Drake TR-4CW cleaning and problems

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-01 02:07:02 UTC
From: Garey Barrell
Topic: 12223 Message: 12256

Doug -

OK. The meter damping may be the problem, or the AVC Delay may be too short. If band noise comes
up between syllables of an SSB transmission or elements of a CW transmission, you may just be seeing
the result of a leakyC115. If you transmit a 'dot', the receiver should return gradually to normal
after a second or two. If the noise pops up immediately, then I'd try swapping C115.

Topic: 12254 Message: 12257

Doug -

I see I misread your earlier message regarding the meter damping.Yes, I have seen a few PLATE meters
lose their damping and get very bouncy. I suspect there is a spring counterbalance that breaks, but
I've never pursued it further. Unfortunately that action was typical of the very inexpensive meters
Drake used. A replacement meter from a donor unit shouldn't be too hard to find. In the 2-NT Drake
just put a large electrolytic cap across the meter ~300 uF @ 6V.

Your problem with the LOAD control is almost certainly the 1N270 diode, D9.

slowcountry1 wrote:
> After a long QSO today on 15 meters, my resurrected TR-4Cw developed an issue with the plate meter and the relative output when the load control is depressed. The plate meter has become very "bouncy" during tune up or normal operation. It acts like whatever was used for dampening is gone. It bounces hard enough that when you stop talking and un-key sometimes the needle gets stuck below 0 and I have to tap on the meter to get it to unstick. The meter never pegs out and displays correct values, it just moves very rapidly without dampening. At or about the same time, I noticed that when I depress the load control to activate the relative output meter, this does not produce a deflection on the plate meter. I checked the switch with an Ohm meter and it appears to open and close properly. Any ideas on these issues?

Gary,

Again, please forgive me for my ignorance. I do not know what the AVC delay is.

I can stop talking and keep the mic keyed and no band noise is heard, I read a small amount of plate voltage, similar to the bias reading I believe. The meter just became extremely bouncy, in other words the needle moves very fast and then bounces back quickly. It almost could make you dizzy watching it swing upward and then downward on voice peaks and valleys; it responds very quickly. I do not know what they used for dampening but its like there was a coil spring attached to the needle for dampening and now its gone.

This obviously does not effect the operation of the radio but if I'm going to the trouble of fixing it up I want to try to fix this up as well.

Thanks for all of your help, it is greatly appreciated!!!

Doug
I had the same thing happen on a swan. in my case there was a 3/8 dia. disk stuck to the magnet and preventing the movement from reading higher that 1/4 of the scale . opened the metre and removed the disk and it worked normally except that is was , like you say very bouncy . opened it again and found where the disk was located and glued it back with a bit of service cement . very tight spot to get to , if like mine (edgewise metre) you will need a non magnetic tweezer to get it back in place . after that it worked properly again .

Fred,

Thank you for the info. I'm going to attempt to remove the meter this weekend and see if there is a way to disassemble and try a repair.

Doug -

ALL the TR-4 meters are the same. The TR-3 meter IS different. But ANY TR-4 meter from a donor

unit will work.

Found an SL-1800 bright & early this morning on our favorite auction site - at much better price than that of a new INRAD.

So - is anyone interested in purchasing an SL-4000 AM filter outright?
$50 + shipping.

Al

Hi Everyone:
I recently purchased a Drake 2-A receiver and am interested in purchasing additional crystals, since I am no too familiar with this receiver what bands can this radio additionally be used on?
I am interested in using it on 160, but don't really know if it can be used on that band.
Please let me know.
Thank you all
Wayne

Wayne -

The 2-A/B can NOT be used on 160M without modification. Any of the R-4 Series receivers CAN be used
on 160 with the addition of a 12.6 MHz crystal.

Attached is a modification from my Service Supplement CD for the 2-B receiver allow 160M operation.
If you plan to invest in this receiver, you might want to take a look at my CD at <www.k4oah.com>.
It will save you lots of time and trouble.

I'm getting close :-) :-)

I got the replacement MIC jacks in the other day and put one in last night. It all went smoothly... except... I found another modification. (You knew that was coming :-)

It seems somewhere along the way R94 (from the MIC to the grid of V18 got replaced with two 300 ohm resistors in parallel. I changed this back to the 47k resistor at the same time I replaced the jack.

So about all I have to do is complete the alignment and then give it a try on the air.

So close :-)

Thank you everyone for your help along this journey.

Mark -

Since most of what we did was done 'off frequency', I'd appreciate it if you would write up a brief
description of what problems you found, and how you found and repaired them. Post it to the list,
get it in the archives!!

I wonder (not being able to see Garey's modification) whether
it would be easier to make a crystal-controlled converter from
160m to the "straight through" 3.5-4MHz band of the 2A/B?

Ian -

That would be one way, the 2-LF moves the bottom 2 MHz of the spectrum up to the 10M band with a
simple mixer and tuned input network.

The mod for 160 is pretty simple, mainly adding capacitance to the BAND A trimmers and a 5.5 MHz
crystal to cover 1.8 - 2.0 MHz.

12272. TR-4CW No transmit audio however full tune up power

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-02 03:19:12 UTC
From: slowcountry1
Topic: 12272 Message: 12272

Ok, here is the story. After searching through the schematic I changed out what I believe to be D9 and D11. I found these two 1N270 diodes on the PC board that hold the transmit relay; they were one on top of the other at the bottom of the board. One had a dead short and the other appeared to be ok. I replaced them both but used 2 1N4148 diodes as the manual calls for and that's what I had available. In addition, I replaced a bunt 27 ohm resister on the same board at the top next to the relay. I also replaced the plate meter and power / volume switch.

I turned the unit on and it powered up as expected. I checked the bias voltage; it was just a touch high so I reset it for 100ma. I tuned up the unit on 10M and I easily achieved 200watts output. The current problem is that when I key the microphone, the plate meter shows 100ma and no higher when I talk into the microphone and as expected my wattmeter indicates a zero output.

Getting the relay PC board in a position to replace the diodes was quite a bit of work and required removing a number of wires. I placed them back where they came from and verified my work against one of my parts rigs. I fear that I have missed something that I just cannot see. Are there any suspect components or areas that I should start pursuing?

Thanks,

Doug

Progress!!. Yes, those diodes are fun to access. I assume that your REL OUT meter and control are
now working. I believe that is what we were working on! I have several of these little 'projects'
going on at a time and it helps to keep them straight if you leave previous message content in place.

Anyway, If you are reading idle current, and TUNE mode produces the expected output, the most likely
problem is a microphone cartridge or miswire. The mic is Tip to PTT and Ring to Input. The relay
wiring and operation in TUNE and SSB is essentially the same, so if TUNE works the only thing left
is V18 or associated wiring/switching.

The 27 ohm resistor is R192 and is a 'fuse' for the +250VDC line. Do NOT replace it with a larger
power resistor, it should be a 27 ohm, carbon composition resistor. They DO fail after years,
because they ARE actually overloaded. Usually a darkened one indicates electrolytic capacitor
leakage in C145. One that is split oftenindicates a short on the +250 VDC line.

If you are seeing 200W OUTPUT on 10M, you need to do the neutralization procedure, check your dummy
load, and wattmeter for accuracy. Anything over ~150W on 10M is highly suspect.

Gary,

The transmit audio was perfectly fine prior to my work. You were guiding me through a plate meter bouncing problem and no relative output on the plate meter when the load control was pressed. The power switch was open and I had shorted it and used a surge suppressor switch to turn it on and off. The rig transmitted just fine until I did the work this evening. I have tried multiple microphones that I know to be good. I have unseated. And reseated all the tubes except the finals.

I'm afraid I did something wrong.

Hi Everyone again:
Just want to know what crystal frequencies should I use to receive shortwave broadcasts on my drake 2-A, without doing any special modification to the rig?
What are the crystal frequencies that the 2-A will accept without doing any modification?
Thank you
Wayne

I replaced V18 will a pull, so I truly don't know how great it is. I got the same results. Any ideas where else to look?

Check the microphone jack you installed against the schematic. That is VERY easy to mess up with any of the Drakes, and have done it myself several times over the years. I probably have at least a 50/50 chance of getting it right first time, hi. Use the schematic as reference though, the one that goes with your serial number range. Your "other one" may be wrong too!!! Been there, done that.

Is there a way your email can be made to post to the top of the message, not the bottom?? It sure makes it hard to find what you said last when it is somewhere in the bottom.

OK. Hoped it would be something easy. Really it can't be too bad, because the entire transmitter
is operational in TUNE, with the exception of the Mic Amp and switching. I don't 'think' any of the
audio wiring is around the relay, so ....

First question. Does the VOX operate when you talk into the microphone? VOX GAIN advanced 1/2
rotation or more? ANTI-VOX full CCW.?

XMIT GAIN advanced?

The MIC audio comes out of the MIC AMP on Pin 8 of V18, through a 0.47 uF film cap to shielded
cable, to the front side of the front wafer of the MODE switch. Then a shielded cable from the
switch to R76 on the bottom of T-14.

12280. Re: [DrakeRadio] Drake 2-A Receiver crystals

Wayne -

Basically the crystal is + 4 MHz from the lowest desired frequency, or -4 MHz from the highest
desired frequency.....

From this you can see that there are two ranges covered by a crystal, depending upon the setting of
the Preselector. Just for example, say you wanted to receive 15 MHz for WWV. To put WWV at the
bottom of the receiver's tuning range, a crystal of 11 MHz would work. Using that same 11 MHz
crystal, you could also cover the 7.0 to 7.6 MHz range, and in fact that is the 40M crystal that
comes with the receiver.

There are six pages of information regarding selection of crystals and the rules involved. If you
don't have a manual, I would strongly suggest that you get one. There is a high resolution scan of
an original manual, along with much more service information, on my Service Supplement CD for the
2-B. Information at <www.k4oah.com>.

From: jnminni@att.net
Topic: 12192 Message: 12283

I finally got around to removing the rear cover on the passband tuner to see what was inside. I pulled out the cam and applied a little lithium grease just for good measure, but I think my intermittency problem was nothing more than a simple cleaning and adjustment of the round pivot on the rear cover. The set seems to be working fine again.
-John/AC8KU

--- In DrakeRadio@yahoogroups.com, "jnminni@..." <jnminni@...> wrote:
>
> My R4B has developed a new "opportunity" for me to work on. The passband tuning has developed an intermittency similar to how a dirty pot would sound when you wriggle the knob. Now I think that inside that passband tuning box there is just a slug that moves in and out of an inductor. So I don't know how to begin with this. Possibly a broken wire or loose connection inside the box would cause this. I suppose that it is also possible that dirty contacts in the bandwidth switch (that shares a concentric shaft with the passband tuning) could be the problem, but really it seems more like it is the passband tuning itself. How would I begin to work on this? How difficult is it to get that passband tuning enclosure apart and, more importantly, how difficult to get it back together.

Date: 2013-03-02 21:11:16 UTC
From: Robert Ross
Topic: 12284 Message: 12284

Hi Guys:

I have FOR SALE the following DRAKE MICROPHONE.....

Model 7077 DESK MICROPHONE for DRAKE TR7 Transceiver
Black Plastic Microphone with DRAKE LOGO that matches the TR-7
Push to Talk and Lock down down Buttons
Original Black Coiled Cord and 4 Pin Female Connector ready to hook up to a Drake TR-7

CONDITION is VG+ and Clean from a NON-Smoking Home
A Few Minor Scuffs on Base, but NO Damage or Dents or Cracks etc. Original Black Coiled Cord is Excellent with no Rubber Rot
Original Microphone Jack in Excellent Condition and Front Grill is Excellent.
Microphone in Good Working Order...ready to use with a TR-7

PHOTOS are Available for anyone interested by EMAIL

PRICE is.....$100.00 USA DOLLARS + $20.00 POSTAGE to NORTH AMERICA ONLY
****
**

PAYMENT is by USPS INTERNATIONAL MONEY ORDER (The Pink Coloured One or CANADA POST MONEY ORDER Only
****
****

SORRY....NO PAYPAL on this
****

To receive Photos by EMAIL or to purchase this Microphone please Email me at.....

Gary,

First off, I owe you a huge apology as I know you are extremely busy and I have asked a million questions of you; this one being very unnecessary.

I worked very diligently, into the late hours, removing the PC board to access D9 and D11. I made notes and was very careful not to get solder on adjacent traces, equipment or allow old solder pieces to remain after my work. I looked the rig over a hundred times to ensure that I did the best job possible. Removing and reinstalling the PC board was quite a tedious and cumbersome task.

I always employ the K.I.S.S. method on any job that I do. Yesterday somehow I forgot the rule and began searching for a very difficult problem that was simple and that I created myself, unknown until now. I was unable to work on the unit until about an hour ago; I spent the day at my daughters volleyball tournament. I poured over the schematics between games and went over every item in my head that I had worked on. When I came home I took your instructions and began examining every part of V18, the PC board that the .47uf cap resides on, the shielded wire and mode switch, I never managed to look at the mic jack. I just so happened to look at the jack and realized that sometime during my project I managed to press down on the disc cap that goes from the mic jack to the PC board that pin 8 of V18 goes to, the long cap lead shorted out the mic jack.

Painfully I can admit that I have wasted your valuable time and a bunch of my time. The good news is that the unit works as it should; the power switch is fixed, the plate meter bouncing is fixed and I again have a relative output. I have ordered the cap replacement kit from Hayseed Hams as this is the next task at hand. I am going to forgo the cleanup process until I research the dry labeling you suggested for the tube compliment.

Prior to replacing the original plate meter, I disassembled it looking to see what was used for dampening. The only thing in there is a magnet that is also used for zero setting. The coil wire, which I managed to break, is soldered to the incoming terminal and makes a U shape to the screw that holds the coil board in place. The other incoming terminal does the same thing. I'm wondering if D9 was not only responsible for the absence of relative output but also if the U shape created a field to assist in dampening? Needless to say, the meter is pretty well shot as I tried to add a little tension in the bracket that holds the needle to see if that would help the bounce and have made it stick in some areas. I took pictures of the meter parts if ever someone wants to know whats inside.

Thanks again for all your assistance!

Doug Coffman

12286. Re: Close to getting by TR-4 done

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-03 00:19:12 UTC
From: Mark Pilant
Topic: 12266 Message: 12286

I just finished up with the alignment, and did some band cruising to see how the receiver did. (It did very well.) I heard lots of activity on the bands (it seems there is a contest going on :-)

I switched over to my dummy load to see how the transmitter would do. Here are the power outputs as read on my Drake MN-2700:

80m 165w
40m 150w (this may be a little off)
20m 160w
15m 150w
10m 130w (for all three positions)

I did test SSB into the dummy load with a mic I normally use on my TR-3, and could watch the meter on the -2700 "dance" around as I talked.

The real test will be getting on the air, which I hope to be able to do in the next couple of days.

If everything goes OK, I'll write everything up so it gets into the archives.

73

12287. TR-3 9MHz osc adjustment

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-03 00:41:27 UTC
From: William Houghton
Topic: 12287 Message: 12287

Hi Garey,

Is there a place where you can measure the 9MHz osc with a freq counter to adjust C130?
A hearing loss makes it hard for me to adjust by trying to get the same pitch by switching sidebands back and forth.

Perhaps the cathode of V16?

Thanks and 73,

Bill

Cool!!! Love the easy fixes, even if theyare sometimes skipped over in our search and take a little
longer to track down. A good catch, in any event.

Anyway, a successful fix is never a waste of time.!

You have an excellent thought with possible diode damping of the PLATE meter. There is yet another
diode buried under the wiring on the Relay Board, D12, in series with a 47 ohm resistor, which has
to also have an effect on the meter. I must admit I never thought much about it, as very few use
the OUTPUT Metering any more. It was very handy for mobile use, and even home station use when
wattmeters were so much rarer. Now that every station has at least one wattmeter in line no one
bothers with the push button any more!

Might be worth some experimentation next time a bouncy meter shows up!

Again, welcome to the group, and congratulations on a successful fix!

Hi Bill -

Best place is probably either of the output leads of T14.

If not enough signal there, then the wiper of R85 is good.

Mark -

You didn't specify, but I assume these readings were made in TUNE position, and tuned for maximum
output?

They are a little low, probably a result of PA tube weakness.

Typical Output in TUNE MODE with NEW PA tubes and fully aligned:

80M= 200W

40M = 200W

20M = 200W

15M = 175W

10M - 150W

Hi Garey,

The wiper of R85 was a good choice. Unfortunately the closest adjustment I can make to 9MHz is 8.99954.

73,

Bill

Subject: Re: [DrakeRadio] TR-3 9MHz osc adjustment

Hi Bill -

Best place is probably either of the output leads of T14.

If not enough signal there, then the wiper of R85 is good.

12292. TR7 probs

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-03 10:12:38 UTC
From: Victor
Topic: 12292 Message: 12292

Hello
Got a problem with my TR7. The VCO's won't lock. Occaisionally the rig works for a couple of minutes and I get sigs but then goes out of lock. The fixed receive button has no effect and the bandswitch does nothing. The display shows either 17mhz or 32 mhz.
I've had it in for repair but they couldn't find the prob. but did say they found a lot of dry joints which they have re-run. I also assume they have checked the connectors.
What I am trying to find out is if I get another VCO board (if I can find one) is there a realistic chance that it would fix the problem or could the fault be almost anywhere in the rig.
That is a very broad question but had to ask.

Hello Victor and group,

I have repaired quite some things in my TR7 and R7s but never came across a VCO issue.
But looking at the block diagram in the service manual, you can see that the VCO board AND the translator board could be involved. Even the digital control board plays a role as it sets the divider. So it is hard to tell whether a new VCO board would fix your issue.

I assume you have done the usual board reseating trick already. If not, do that first. Remove DR7, VCO and translator board, examine the contacts and carefully put it all back.

There is one thing people have often come across: the 24 V supply which is needed to tune your VCO! It is derived at the power supply board with a dc/dc converter. The core of this converter sometimes gets loose or even falls off. So if you want to start trouble shooting yourself, measure if all the voltages are fine when you error condition happens. Try to measure close to the VCO board, e. g. at the parent board.

From: jerry_k9gas
Topic: 12294 Message: 12294

Hi All,
I've got an issue that really just started with my R4C. I get nice audio and proper signal on the meter when using AM. On SSB, it's really low audio and no signal showing on the meter as well. I haven't tried cleaning yet. It was gone through petty much last June by SAJ. I've tried moving the band and function switches back and forth to see if that would help, but it's not doing it. Oxidation likely? I thought it would be best to post here before I dive into it and hopefully get some pointers from the experienced. Thanks, Jerry K9GAS

12295. Re: [DrakeRadio] TR-3 9MHz osc adjustment

I had another thought about adjusting the 9 MHz oscillator.

Would it be reasonable to feed an AM modulated signal (say 800 Hz) into the antenna at a frequency appropriate for the band/dial setting and then adjust C130 until the tone was the same between USB and LSB?

It seems like this might be a good way to adjust the oscillator to the rig.

Just a thought.

Hi Garey.

> You didn't specify, but I assume these readings were made in
> TUNE position, and tuned for maximum output?

That is correct. In all cases, the max output came at about a
450 mA reading on the plate current meter.

> They are a little low, probably a result of PA tube weakness.

Could very well be. Given the "crud" on the chassis, I expect
the rig had been sitting for some time; not out in the elements,
but probably a shed or something. (Thus the acorn shells which
came out when I turned the rig over at one point.)

I'm planning to order a new set of finals, I just need to make
sure I can get tubes which will fit in the final "cage".

Until then, I'm going to try one or two more tests, and then
see if I can check in to the Drake net this afternoon.

Also, the electrolytic capacitor(s) on this board should be replaced. Don't bother with checking them to test if they are good, just DO IT. This is a critical point, strange things will happen when the 24V filter even starts to fail. And they are starting to fail. This should be a standard replacement on any TR-7. Use parts rated for 105C temperature. The Tantalum caps should be fine, they can be left alone.

Of course, you will need to re-adjust the fixed passband and +10V pots after working on the PS board.

Vic -

First suspect is the +24 VDC supply. This is a little DC-DC converter on the Power Supply board,
which includes a ferrite cored transformer. The core consists of a couple of "E" cores 'face-to-face' and glued together. After only 30 years or so the glue is letting go, allowing the
'top' half of the core to fall into the bottom of the radio. If whoever serviced the radio wasn't
aware of this, the loose core is often lost unnoticed when the coversare removed. Looking down from
the front of the radio, you can see the transformer, it has one wrap of white hookup wire wrapped
around it. If you see the three 'ends' of the lower "E", that's the problem. If you see just the
straight 'back' of the "E" it's still possible that the core is 'gapped' and you'll need to check
the voltage. It should be very close to +24 VDC, 78L24 regulator.

The 17 and 32 MHz frequencies are thecorrect 'unlocked' frequencies for the VCOs.

OK. Sounds good. Nothing wrong with running those tubes for years yet. The difference in output
power is barely discernible at the other end, and it doesn't hurt anything else.

The 'tootall' tubes are interesting. They're outside of the size specifications of the 'big four',
Sylvania, Zenith, RCA & GE, by a considerable amount. I've never seen any by these mfrs. I'm
pretty sure Sylvania didn't rebrand, and Zenith was a contract with Sylvania. I guess it's possible
RCA and/or GE rebranded, but....

Anyway, just tell the seller you want tubes with a maximum 'seated height' of 3.125".

Garey, Jim, Dieter and others,
Thank you for your replies and suggestions. It seems the first point to look at is the +24v supply. I did
open it when it came back from repair and later found what looked like a ferrite bead on the shack floor - but that could have come from
anywhere. Just one other question, if the +24v supply is faulty (part of the core missing) would the rig briefly work OK for a short
period (secs) and then go back to unlocked?

Cheers

Vic

David,

That plug is near "unobtanium" anymore, and usually very expensive if you find one. Drake made a "kit" later to convert that to an RCA jack, and John Kriner had some of those for sale on his Ebay store a while back. I haven't looked lately, but John is "tr7dude" on Ebay and easily found. The kits are also expensive, but not as bad as the plug. Hope that helps some.

Hi Garey,
yes it's pretty much all across. I paid closer attention and it's even down on AM.
I'm comparing it with my solid state rig. But, it was better than anything I've had, but it's really down. Only very strong stations will get it move the meter. S7 signals on my solid state, is not moving my receive on the R4C and the audio is way down.
I was going to take it down and start a cleaning process of the pins and all the contacts and
see what that does. This thing was a very hot receiver, not now.
Thanks,
Jerry K9GAS

All,

I have uploaded two pictures of the TR-4Cw plate meter internal assembly. I also added some illustration. Prior to destroying a meter like I did, check that D9,D11 and D12 are all good. The configuration of the meter suggests that electrical dampening of the needle may be used here.

In addition, the coil wire is hair fine and breaks very easily. The meter comes apart very easily but with big clumsy hands, I managed to break it.

Regards,

Doug Coffman

Hi all; a brief search didn't result in a finding, but what is the manuf. part no./avail. for the linear relay male plug to fit into the AC4 recept, curiously labeled "VOXRLY"?

Just got a SB220, and now anxious to try it out.

TIA, WB4SPT

It's not the 2 pin plug...it is the 2 pin to RCA jack modification kit (The Drake one) so that you can plug in the relay line to the L-4. (Most are RCA jacks) Someone used to make and sell a cable with an RCA jack on one end and the 2 pin Drake plug on the other end but I didn't see any on eBay.

David,

If you do not want to make a plate with an RCA female to replace the two pin jack then you could make a short pig tail with an RCA female on one end and route the cable through a hole in the chassis. The leads from the cable would be soldered soldered across the two pin socket. The relay contacts in the T-4XC are isolated, neither is at ground potential, so it doesn't matter which side of the plug is wired to the shell or center contact. You can then use a "standard" RCA male/RCA male cable between the pig tail and your amp.

12314. Re: [DrakeRadio] Low SSB receive R4C

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-04 00:31:22 UTC
From: Steve Wedge
Topic: 12294 Message: 12314

I worked on one during the past year that had bad connection to the SSB filter. The received signal dropped off about 30 dB (as indicated by the S meter) between CW500 and SSB 2.4, referenced to the CW500 strength. I re-flowed the solder on the filter pins and re-seated the ground connections.

That filter isn't easy to reach: it's on the main chassis and not on the rear panel.

Good luck...

Hi All,
I've got an issue that really just started with my R4C. I get nice audio and proper signal on the meter when using AM. On SSB, it's really low audio and no signal showing on the meter as well. I haven't tried cleaning yet. It was gone through petty much last June by SAJ. I've tried moving the band and function switches back and forth to see if that would help, but it's not doing it. Oxidation likely? I thought it would be best to post here before I dive into it and hopefully get some pointers from the experienced. Thanks, Jerry K9GAS

Well even though it didn't look dirty or oxidized at all, a good cleaning fixed it right up.
Cleaned the 6ba6 socket and finished up with some deoxit on the pins and I have full receive again!!

12317. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-04 04:56:08 UTC
From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 12317

All group members are welcome to post on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others. No one is 'keeping score' (I hope!)

PLEASE use the 'Reply All' function of your e-mail client so replies are posted to the list. A 'Reply' to the original poster ONLY, deprives the rest from seeing an answer, AND greatly diminishes the value of the List archives.

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our group's home page, as well as links to Drake information or your homepage.

Just a word of advice for R-7 / TR-7 owners 'with a problem'. I estimate that 90% of 'failures' in these units are caused by minor oxidation of a switch, the card and/or cable connectors. Whether it's a problem that just shows up at turn-on, -OR-, after the unit has been unused for a while, DeoxIT'ing switches and just re-seating cards and connectors will often get it going again. If not, you know where we are!

73, Garey - K4OAH

From: daveincaol
Topic: 12320 Message: 12320

Does anyone in the UK have an AC-3 or 4 power supply for loan or purchase? I know I could buy one off Ebay but I don't intend paying $100 for carriage from the US.
Once I do get hold of one I will arrange for my 'local' ARC to check out a Tx and Rx that I have been asked to sell on.
Incidentally I only got one 'bite' when I listed the 5 items as available in an earlier post.
Anyone got any comment re this Item on Ebay: 181086635459. The 'asking' seems a tad unrealistic to me.

Hi, Gang -

I'm awaiting my latest eBay find: an original R-4. Going to 'HFN's website, I can't find much info on them but I seem to recall they were made between 1959 and '61. Am I close?

The big differences I notice right off are the concentric AF/RF GAIN, no INJ jack and, of course, no reduction drive for the PRESELECTOR. I've heard it's roughly the same as the 13-tube R-4A otherwise. Any other tidbits?

Hi Steve,

You're not even close, I don't think...

The R-4 was the predecessor to the long line of R-4 derivatives that followed. i.e. the "A", "B", & the "C" versions. I understand that it's closest kin is the Drake 2B receiver.

I'm sure that Garey can shed a LOT more light on the subject than I am able to!

BTW, I have an R-4 here---and I LOVE it.

Hi Steve,
Going another way; I have my original R4 # 270 My manual shows the schematic number as 29650001 which would be Feb 9, 1965 serial number 0001 which would indicate it was the first applicable schematic.

On the other hand...the T4X records on WB4HFN indicate that there were 10000 units in 1965 with another 2000 built to 1966 (now it could have been a VERY popular item that year). In any case subtracting 2k units per year from the 1965 would mean that the original T4X was about 1960 and I always thought that Drake brought out the R & T at the same time.

Anyone else going to wade into this? Carl wd8nhk

Jerry -

Might be the tube..... Not likely though.... I'd look for a bad solder joint, looking first
under the 6BA6 you 'fixed' it with yesterday.

Do you have any accessory IF filters? If so, does selecting one of them change the situation? If
nofilters available, stick a 150 ohm, 2W resistor (any low value) diagonally between the 'hot' legs
of one of the accessory sockets and see if selecting that filter position 'fixes' things.

If it works again the next time you turn it on, check the Plate, Screen and Cathode voltages on the
first five tubes and recordthem. Then, when it quits again, recheck those same readings.

If it does NOT work the next time you turn it on, make those same readings anyway and see how they
compare with the Voltage chart in the manual.

Subject: [DrakeRadio] AC-4 Supply in theUK

Does anyone in the UK have an AC-3 or 4 power supply for loan or purchase? I know I could buy one off Ebay but I don't intend paying $100 for carriage from the US.
Once I do get hold of one I will arrange for my 'local' ARC to check out a Tx and Rx that I have been asked to sell on.
Incidentally I only got one 'bite' when I listed the 5 items as available in an earlier post.
Anyone got any comment re this Item on Ebay: 181086635459. The 'asking' seems a tad unrealistic to me.

Hi Dave
Are you still in GM Land ?
If so maybe someone in the GM DX Club might have one, maybe you can put a post on their reflector.

If you were in the South !! I could lend you one.

The power cord is correct: the serial number in the 55000's is consistent with a 3-wire cord. It probably also has the 120/240 switch on the other side - which does make it worth more based on what I've seen them go for. Still, $350 is high but I have seen these sell for $250. I sold a nice one (totally stock) for $185 not long ago and it went fast.

Oops - I didn't look at the entire listing. Looks like the 120/240 switch is not there - even though the hole is there in the chassis for it. It's curious there's no silkscreen there for 120/240. Does anyone know if Drake was making two different versions at the time?

I'll never say never, but it's unlikely he'll get his asking price...

Thanks, Garey.

Let me know if you'd like any pics of the innards for your files. This one looks like it's pretty clean but is not functioning. At any rate, I'll be doing my usual clean-up on it, so I'll have lots of opportunities to photograph it with my DSLR and some macro lenses.

I figured there weren't nearly as many made as the A's, B's or C's and what you've said confirms that.

Hoping the PO doesn't abuse this one like it just did to an R-4B I just sold...

One can always ask what one wants for anything. Sometimes, when a seller gets lucky, a buyer comes along who's willing to pay a crazy price. It's the basis of capitalism: someone freely paying an agreed-upon price in exchange for an item. Usually the market takes care of a high price by letting the item languish.

I've sold some Drake gear lately at what I consider to be reasonable prices and they're selling very quickly, which usually indicates the price could come up some. However, I like the fact that I've had folks buy the rigs who are happy with what they've bought.

12343. TR-4Cw cathode and grid resistors

Yahoo group: DrakeRadio (2013-01 — 2013-06)
Date: 2013-03-04 20:43:07 UTC
From: slowcountry1
Topic: 12343 Message: 12343

I have finished the work that I had planned on my TR-4Cw. Prior to putting it back in its case, a local knowledgeable ham suggested that I check the values of the cathode and grid resistors. My knowledge of tubes is very limited, I believe this is what he called them.

The schematic that I have is very faint. I see resistors R176, R177, R178 that connect between pins 1 and 7 on the 6JB6 PA tubes. The values with the tubes removed is 69.3, 69.4 and 69.2 ohms. The schematic looks like it wants 68 ohms, very hard to read. I believe these to be the grid resistors.

I see resistors R93, R167 and R121 that connect between pins 3 and 9 on the 6JB6 PA tubes. The values with the tubes removed is 16.2, 17.0 and 16.7 ohms. The schematic looks like it wants 15 ohms, again very hard to read. I believe these to be the cathode resistors.

First off, can someone verify that I have used grid and cathode resistors as the correct terms; second are these values close enough in tolerance or should I replace them (I would have expected a carbon comp resistor to increase in resistance); third have I measured the correct resistors at the correct pins?

I made the measurements with my Fluke 289 and double checked against another DVMM so I'm content that the readings are accurate.

I have replaced the electrolytics with the Hayseed Hams product. Are there any other items that I should check prior to putting the unit into normal everyday use?

Thanks,

Doug

Hello Vic,

I doubt the dc/dc converter works at all without the core. Hard to say
whether you may have LOCK condition for a short time. Probably not.

But the behaviour you describe could be caused by what Jim indicated:
bad electrolytics.

Anyway, check the 24 V supply. It is a good start.

Doug -

Almost. Resistors R42, 43 and 44 are the Screen Grid (commonly called 'Screen') resistors and are
the ones to check. Pin 2 is the Control Grid (commonly called 'Grid') and in this case have no
resistors.

Most resistors are 5% tolerance, which is indicated by the fourth color band on the resistor being
'gold'. If the fourthband is 'silver', the resistor is 10%. This is the tolerance for the value
marked when new. So 68 ohm +/- 6.8 ohms is what you should read as these are 10% resistors.

The 15 ohm resistors are also marked 10%, but Drake tightened that up to 5% since it directly
affects how total current is shared by the three tubes. This means they should be 15 ohms +/- 0.75
ohms. Yours are out of spec even at 10% and should be replaced. It's best if they are all within
5% of each other. The best replacements are the Ohmite OY ceramic composition resistors. Carbon
and metal film resistors don't hold up well under the current surges these resistors are subject to.

Doug -

Missed your last question.... Check R192 for condition and value. This is a 'fuse' for the +250
bus and normally increases in value, DO NOT replace with a larger resistor, 27 ohm, 1/2W carbon
componly.

See attached on earlier message.

Is it important that the cathode resistors be within 5% of 15 ohms, or within 5% of each other reasonably close to 15 ohms?

Barry - N4BUQ

Barry -

Relative tolerance is really more important. But these resistors are run pretty hard so power
dissipated goes up rapidly as value increases, giving a snowball effectif values increase too much.
Each resistor canhave 150 mA of current in TUNE and higher still in peaks.

G

Gary,

Now that I have the correct resistor numbers, did I have the correct locations between pins 1 and 7 and 3 and 9 or do I also have the location incorrect?

Thanks again,

Doug

Doug-

See attached to previous message. The three resistors in question come together at a terminal strip

tag.
